Hazardous Material Containment in Concrete Structures—Report

Copyright by the American Concrete Institute, Farmington Hills, MI. All rights reserved. This material may not be reproduced or copied, in whole or part, in any printed, mechanical, electronic, film, or other distribution and storage media, without the written consent of ACI.

The technical committees responsible for ACI committee reports and standards strive to avoid ambiguities, omissions, and errors in these documents. In spite of these efforts, the users of ACI documents occasionally find information or requirements that may be subject to more than one interpretation or may be incomplete or incorrect. Users who have suggestions for the improvement of ACI documents are requested to contact ACI via the errata website at <http://concrete.org/Publications/DocumentErrata.aspx>. Proper use of this document includes periodically checking for errata for the most up-to-date revisions.

ACI committee documents are intended for the use of individuals who are competent to evaluate the significance and limitations of its content and recommendations and who will accept responsibility for the application of the material it contains. Individuals who use this publication in any way assume all risk and accept total responsibility for the application and use of this information.

All information in this publication is provided “as is” without warranty of any kind, either express or implied, including but not limited to, the implied warranties of merchantability, fitness for a particular purpose or non-infringement.

ACI and its members disclaim liability for damages of any kind, including any special, indirect, incidental, or consequential damages, including without limitation, lost revenues or lost profits, which may result from the use of this publication.

It is the responsibility of the user of this document to establish health and safety practices appropriate to the specific circumstances involved with its use. ACI does not make any representations with regard to health and safety issues and the use of this document. The user must determine the applicability of all regulatory limitations before applying the document and must comply with all applicable laws and regulations, including but not limited to, United States Occupational Safety and Health Administration (OSHA) health and safety standards.

Participation by governmental representatives in the work of the American Concrete Institute and in the development of Institute standards does not constitute governmental endorsement of ACI or the standards that it develops.

Order information: ACI documents are available in print, by download, through electronic subscription, or reprint and may be obtained by contacting ACI.

Most ACI standards and committee reports are gathered together in the annually revised the ACI Collection of Concrete Codes, Specifications, and Practices.

The committee would like to express thanks to the following for their contributions to this report: ... Michael*, D. Poole*§, L. Schulze*, and J. Zanotti*.

*Members of ACI 350 Hazardous Materials Subcommittee who prepared this report.

†Chair of ACI 350 Hazardous Materials Subcommittee.

‡Vice Chair of ACI 350 Hazardous Materials Subcommittee.

§Secretary of ACI 350 Hazardous Materials Subcommittee.

‡Deceased.

This report presents recommendations for structural design, materials, and construction of structures commonly used for hazardous materials containment, including reinforced concrete walls, sumps, and other structures that require dense, impermeable concrete with high resistance to chemical attack. The report discusses and describes design and spacing of joints, proportioning of concrete, placement, curing, and protection against chemicals. Information on liners, secondary containment systems, and leak-detection systems is also included.

Keywords: chemical protection; liner; construction joint; containment systems; gas-tight; hazardous materials; joint sealant; liquid-tight; precast concrete; prestress; water-permeability materials ratio; waterstop.

ACI Committee Reports, Guides, and Commentaries are intended to provide guidance in planning, designing, executing, and inspecting construction. This document is intended for the use of individuals who are competent to evaluate the significance and limitations of its content and recommendations and who will accept responsibility for the application of the material it contains. The American Concrete Institute disclaims any and all responsibility for the stated principles. The Institute shall not be liable for any loss or damage arising therefrom.

Reference to this document shall not be made in contract documents. If items found in this document are desired by the Architect/Engineer to be a part of the contract documents, they shall be restated in mandatory language for incorporation by the Architect/Engineer.

CHAPTER 1—GENERAL

1.1—Scope

This report provides guidance for the design and construction of hazardous material containment systems involving reinforced concrete construction. Hazardous material containment structures require secondary containment and, sometimes, leak-detection systems. Because of the economic and environmental impact of even small amounts of leakage of hazardous materials, both primary and secondary containment systems should be virtually leak-free. Therefore, when primary or secondary containment systems involve concrete, special design and construction techniques are required. This report supplements and enhances the requirements of ACI 350, Code Requirements for Environmental Engineering Concrete Structures, which is intended for structures commonly used in water containment, industrial and domestic water, and wastewater treatment works. ACI 350, however, does not give specific guidance on the design of the double containment systems, leak-detection systems, or the additional recommendations for enhancing liquid-tightness covered in this report. This report does not apply to primary or secondary containment of cryogenic liquids, nonliquid materials, or to systems containing radioactive materials. This document does not cover material storage requirements or environmental impacts of leaching.

The use of information in this report does not ensure compliance with applicable regulations. The recommenda-

tions in this report are based on the best technical knowledge available at the time they were written; however, they may be supplemented or superseded by applicable local, state, and national regulations. Therefore, it is important to research such regulations thoroughly. (Refer also to Section 8.1.)

Guidelines for containment and leakage-detection systems given in this report involve combinations of materials that may not be readily available in all areas. Therefore, local distributors and contractors should be contacted during the design process to determine what materials are available.

Thorough inspection of construction is essential to ensure a quality final product. The written program for inspection should be detailed and comprehensive and should be clearly understood by all parties involved. See Section 4.3 for an inspection checklist. (Refer to ACI 311.4R for guidance in inspection programs.) A preconstruction conference to discuss the program in detail is recommended. Personnel should be qualified, experienced, and certified as applicable to their specialty.

1.2—Definitions

Please refer to the latest version of ACI Concrete Terminology for a comprehensive list of definitions. Definitions provided herein complement that resource.

ancillary equipment—ancillary equipment includes piping, fittings, valves, and pumps.

coating—a very low permeability barrier material that is bonded to the concrete and that is used to prevent fluid (or gas) migration through the concrete.

hazardous material—a hazardous material is defined as having one or more of the following characteristics: ignitable, corrosive, reactive, or toxic.

NOTE: The U.S. Environmental Protection Agency (EPA) listed wastes are organized into three categories under the Resource Conservation and Recovery Act (RCRA): source-specific wastes, generic wastes, and commercial chemical products. Source-specific wastes include sludges and wastewaters from treatment and production processes in specific industries such as petroleum refining and wood preserving. Generic wastes include wastes from common manufacturing and industrial processes such as solvents used in degreasing operations. Commercial chemical products consist of chemicals such as benzene, creosote, mercury, and various pesticides. Hazardous materials are considered to include liquids that are classified as a physical hazard, health hazard, or hazard not otherwise classified, each as defined herein. The Code of Federal Regulations (CFR) Title 40—Protection of Environment, Part 261 Identification and Listing of Hazardous Waste may also be helpful in identifying categories of hazardous materials pertaining to this document.

health hazard—a chemical classified as posing one of the following hazardous effects: acute toxicity (any route of exposure); skin corrosion or irritation; serious eye damage or eye irritation; respiratory or skin sensitization; germ cell mutagenicity; carcinogenicity; reproductive toxicity; specific target organ toxicity (single or repeated exposure); or aspiration hazard.
