First printing, March 2025

Discussion is welcomed for all materials published in this issue and will appear ten months from this journal's date if the discussion is received within four months of the paper's print publication. Discussion of material received after specified dates will be considered individually for publication or private response. ACI Standards published in ACI Journals for public comment have discussion due dates printed with the Standard.

The Institute is not responsible for the statements or opinions expressed in its publications. Institute publications are not able to, nor intended to, supplant individual training, responsibility, or judgment of the user, or the supplier, of the information presented.

The papers in this volume have been reviewed under Institute publication procedures by individuals expert in the subject areas of the papers.

Modeling and Performance Assessment of Concrete Structures

This Symposium Volume reports on the latest advancements related to the various facets of modeling and performance assessment of concrete structures. The volume contains 10 papers that were presented at the ACI Convention held in Toronto on April 1st, 2025. The symposium was dedicated to celebrate Prof. Frank J. Vecchio's extraordinary research contributions and accomplishments in the development of behavioral models and analytical tools for the assessment of concrete structures.

The papers cover different aspects related to modeling and performance assessment of concrete structures including developments of the Modified Compression Field Theory, finite element modeling of punching shear in slabs, behavior and modeling of steel fiber reinforced concrete members subjected to torsion, modeling of concrete structures subjected to impact loading, behavior and modeling of slender walls, modeling of concrete frame elements, behavior and modeling of GFRP reinforced members, crack based assessment of concrete structures, and advancements in modeling deterioration mechanisms and repaired concrete structures.

Sincere acknowledgements are extended to all authors, speakers and reviewers as well as to ACI staff for making this symposium a success.

TABLE OF CONTENTS

SP-365-1:

Finite Element Analysis and Design of Shear Behaviour of RC Slabs Supported on Walls1-16

Authors: Graeme J. Milligan, Maria Anna Polak and Cory Zurell

SP-365-2:

Recent Developments in Torsion Design of SFRC Elements17-34

Authors: Luca Facconi, Ali Amin, Fausto Minelli and Giovanni Plizzari

SP-365-3:

Historical Development of the Simplified Modified Compression Field Theory35- 9

Authors: Evan C. Bentz and Michael P. Collins

SP-365-4:

Material Modeling for Concrete Structures Subjected to High Strain Rate Deformation 50-78

Authors: Neul Oh, Junhwi Ye, Hyukjun Ahn and Jae-Yeol Cho

SP-365-5:

Damage and Failure of RC Flat Slabs Subjected to Impact Loading 79-92

Authors: David Z. Yankelevsky, Yuri S. Karinski, and Vladimir R. Feldgun

SP-365-6:

Response and Modelling of Slender Wall Subjected to Lateral and Axial Loading93-112

Authors: Austin Martins-Robalino, Alessandro Paglia, and Dan P. ...

SP-365-7:

Nonlinear Modeling of Concrete Frame Elements including Shear Effects 113-134

Author: Serhan Guner

SP-365-8:

The Effect of Bond on the Behavior of GFRP Reinforced Deep Beams135-147

Authors: Taylor Brodbeck, Giorgio T. Proestos, and Rudolf Seracino

SP-365-9:

Toward Crack-Based Assessment of Existing Reinforced Concrete Structures148-164

Authors: Amirali Bahnamiri and Trevor L. Hlynik

SP-365-10:

The Evolution of the Modified Compression Field Theory for Modeling Existing

Concrete Structures: Field Assessment, Deterioration, and Repair165-184

Authors: Anca Ferche and Vahid Sadeghian

**FINITE ELEMENT ANALYSIS AND DESIGN OF SHEAR BEHAVIOUR
OF RC SLABS SUPPORTED ON WALLS**

Graeme J. Milligan, Maria Anna Polak and Cory Zurell

Synopsis: Due to the low lateral stiffness of slabs supported on columns alone reinforced concrete flat plates are typically combined with other structural elements, such as shearwalls. In these structures, the slab-column connections are designed to carry gravity loads only, and the shearwalls, which also carry gravity loads, are required to resist the lateral forces. Therefore, the slab-wall connections (SWCs) are essential for the adequate performance of both the gravity and lateral force resisting systems. However, the majority of punching shear research and design provisions have been focused on slab-column connections, even though punching failures around slab-wall connections have been observed experimentally. Empirical testing of slab-wall connections is difficult due to the required specimen size. This paper investigates the punching shear behaviour of interior slab-wall connections subjected to concentric vertical loading, and combined concentric vertical loading and uniaxial unbalanced moment using a plasticity-based nonlinear finite element model (FEM) in ABAQUS. The FEM, developed to study the impact of column aspect ratio on punching shear, was calibrated considering seven isolated slab-column specimens. The analysis of isolated slab-wall connections demonstrates that punching failures can occur before one-way shear failures, although the connection capacity is much higher than the expected loads in most structures. Punching shear design methods for interior slab-wall connections subjected to gravity load only, developed from finite element analysis results, are developed and presented in the paper.

Keywords: finite element analysis, punching shear, Reinforced Concrete Slabs, Slab-Wall Connections, Unbalanced Moment, Design Methods
