## INORGANIC ZINC SILICATE PAINT

[Title allocated by Defence Cataloguing Authority:  
PRIMER COATING (Zinc Silicate): No. Supply Classification:  
8010]

---

**STANDARDS ASSOCIATION OF AUSTRALIA**  
*Incorporated by Royal Charter*

THE FOLLOWING INDUSTRIAL, SCIENTIFIC, CONSUMER AND GOVERNMENTAL organizations and departments were officially represented on the committee entrusted with the preparation of this standard:

Australian Electrical and Electronics Manufacturers Association  
Australian Federation of Consumer Organizations  
Australian Paint Manufacturers Federation  
Confederation of Australian Industry  
CSIRO, Division of Building Research  
Department of Defence  
Government Paint Committee  
National Association of Australian State Road Authorities  
National Association of Testing Authorities  
Oil and Colour Chemists Association  
Railways of Australia Committee  
Royal Australian Institute of Architects  
University of Melbourne

---

This standard, prepared by Committee CH/3, Paints, Varnishes and Related Materials, was approved on behalf of the Council of the Standards Association of Australia on 3 April 1980, and was published on 1 July 1980.

---

To keep abreast of progress in industry, Australian standards are subject to continuous review and are kept up-to-date by the issue of amendments or new editions as necessary. It is important therefore that standards users ensure that their standards are up-to-date. Full details of all SAA publications will be found in the Annual List of Australian Standards; these details are supplemented by listings in the SAA monthly journal 'The Australian Standard'. Information on the Annual List and 'The Australian Standard' may be obtained from any sales office of the Association, where details are also available of the current status of individual standards. Suggestions for improvements to published standards, addressed to the head office of the Association, are welcomed.

**ISBN 0 7262 1931 2**

## PREFACE

This standard was prepared by the Association's Committee on Paints and Varnishes under the direction of the Chemical Standards Board, to supersede AS 2105—1978. It is one of a series being prepared by the committee to provide a system for the protection of iron and steel against atmospheric corrosion.

During the preparation of the standard, the committee considered the following publications:

CGS 1-GP-171d	Standard for Inorganic Zinc Coatings*
ISO/DIS 3549	Zinc Dust Pigment for Paints
CD 502	Self Cure Inorganic Zinc Silicate Paint†
Steel Structures	Painting Council‡—Tentative Specification—SSPC— Paint 20 × 72 P, Type 1 Inorganic Zinc Rich Coating.

This edition of the standard differs from the 1978 edition in that the particle size of dry pigment has been reduced from 150  $\mu\text{m}$  to 75  $\mu\text{m}$ , the allowable loss of mass for Type 3 coatings has been increased to 0.40 g, and a method for the determination of the abrasion resistance of aged coatings has been added.

Impact tests and other mechanical tests are still being investigated.

Requirements such as container sizes, product approval schemes and conditions of supply are non-technical matters which are likely to arise during purchasing negotiations. Such requirements are provided for in Appendix A.

Independent testing required for the settlement of disputes also requires agreement. It is important to note that there are laboratories registered with the National Association of Testing Authorities, Australia for the fields and classes of test referred to in this standard.

This standard may require reference to the following standards:

AS 1511	SAA High-strength Structural Bolting Code
AS 1152	Test Sieves
AS 1580	Methods of Test for Paints, Varnishes, Lacquers and Related Materials Method 102.1—Recommended Sampling Procedure Method 107.3—Determination of Wet Film Thickness by Wheel Gauge Method 108.1—Measurement of Dry Film Thickness on Iron and Steel Substrates (Permanent Magnet Instrument)
	Method 105.1—Determination of Pencil Hardness of Paint Film
	Method 458.1—Resistance to Wetting
	Method 106.1—Metallic Zinc Content
AS 1627	Code of Practice for Preparation and Pretreatment of Metal Surfaces Prior to Protective Coating Part 1—Abrasive Blast Cleaning of Steel Surfaces
ISO/DIS 3549	Zinc Dust Pigment for Paints

\*Issued by Canadian Government Specifications Board.

†Issued by National Ministry of Works.

**for**  
**INORGANIC ZINC SILICATE PAINT**

## FOREWORD

The preparation of standards for long-life high duty protective coating systems such as inorganic zinc silicate paint presents considerable difficulties. Field performance cannot be correlated with short-term laboratory tests and there is not sufficient published information available to enable detailed composition specifications to be prepared.

An important criterion in the assessment of inorganic zinc silicate coating systems is the cost per square metre per year of protection. This depends mainly on the amount of zinc per square metre which in turn depends, assuming competent manufacture, on the volume solids content and the zinc content in the dried film. However, the use of this standard which contains limited composition and performance requirements together with a knowledge of the performance of established coating systems should assist users in the selection of a suitable coating system.

This standard covers four types of inorganic zinc silicate paints, each typified by high zinc dust content and a basically inorganic vehicle formula. They provide a hard, corrosion-resistant protective coating for iron and steel.

Inorganic zinc silicate paints consist of zinc in finely divided metallic form dispersed in a matrix of silica.

The term 'inorganic' refers to the material in the matrix and is intended to exclude paints based on organic matrices, e.g. epoxy, phenolic or polystyrene. The solvent-borne inorganic zinc silicate paints described in this standard as Type 4 are true inorganics. The organic solvent and the organic material combined in the alkyl silicate vehicle are lost by evaporation during drying and by reaction with airborne moisture during curing, thus leaving a completely inorganic film of paint.

## SECTION 1. SCOPE AND GENERAL

**1.1 SCOPE.** This standard specifies requirements for inorganic zinc silicate paint intended for use in the protection of iron and steel against atmospheric corrosion.

**NOTES:**

1. Supplementary information that is to be supplied by the purchaser is set out in Appendix A.
2. Additional notes on typical uses and information on inorganic zinc rich paints are given in Appendix B.

**1.2 DEFINITION.** For the purpose of this standard, the following definition applies:

*Inorganic zinc silicate paint*—a material consisting essentially of a dispersion of metallic zinc dust in inorganic silicate medium.

**1.3 CLASSIFICATION.** Inorganic zinc silicate paints shall be classified as follows:

- (a) *Type 1*—a multi-component inorganic zinc silicate waterborne paint which requires the application of heat to effect curing of the paint.
- (b) *Type 2*—a multi-component inorganic zinc silicate waterborne paint which requires the application of a curing agent to a previously applied two-component primer base.

(c) *Type 3*—a multi-component inorganic zinc silicate waterborne paint which self-cures by loss of water and subsequent reaction with atmospheric moisture.

(d) *Type 4*—a single-component or multi-component inorganic zinc silicate solvent-base paint which self-cures by loss of solvent and subsequent reaction with atmospheric moisture.

**NOTE:** Additional information on the composition and use of these paints is contained in Appendix B.

**1.4 CONDITION.** The product shall be supplied in such a condition as will ensure, after mixing and blending, and if necessary the addition of thinners, that the product is suitable for application by means of brush, roller or commercial spraying equipment.

**1.5 COLOUR.** To overcome difficulties of differentiating between a coating of paint and a freshly prepared surface, the product may contain suitable tinting pigments.

**NOTE:** The colour is typically characteristic of the zinc dust pigment contained in the product but has different shades according to the application conditions.
