

Australian Standard™

**Keyboarding speed tests
(formerly known as
'Typing speed tests')**

S t a n d a r d s Australia

This Australian Standard was prepared by Committee MS-016, Keyboarding and Shorthand Speed Tests. It was approved on behalf of the Council of Standards Australia on 2 March 2001 and published on 20 March 2001.

The following interests are represented on Committee MS-016:

Australian Council for Private Education and Training (ACPET)
Canberra Institute of Technology
Catholic Education Office
Commercial Education Society of Australia
Department of Employment Training and Industrial Relations (Qld)
Department of Training and Employment, W.A.
Group Training Australia, Victoria
Northern Territory University
Office of Training and Further Education, Victoria
Recruitment and Consulting Services Association
TAFE, N.S.W.

Keep Standards up-to-date

Standards are living documents which reflect progress in science, technology and systems. To maintain their currency, all Standards are periodically reviewed, and new editions are published. Between editions, amendments may be issued. Standards may also be withdrawn. It is important that readers assure themselves they are using the current Standard, which should include any amendments which may have been published since the Standard was purchased.

Detailed information about Standards can be found by visiting the Standards Australia web site at www.standards.com.au and looking up the relevant Standard in the on-line catalogue.

Alternatively, the printed Catalogue provides information current at 1 January each year, and the monthly magazine, *The Australian Standard*, has a full listing of revisions and amendments published each month.

We also welcome suggestions for improvement in our Standards, and especially encourage readers to notify us immediately of any apparent inaccuracies or ambiguities. Contact us via email at mail@standards.com.au, or write to the Chief Executive, Standards Australia International Ltd, GPO Box 5420, Sydney, NSW 2001.

PREFACE

This Standard was prepared by the Standards Australia Committee MS-016, Keyboarding and Shorthand Speed Tests, to supersede AS 2708—1991, *Typing speed tests*.

The objective of the Standard is to provide a uniform method of testing for use by bodies that conduct, assess and certify keyboarding tests for speed and accuracy.

The Standard provides a test method that facilitates the comparison of individual keyboarding speeds. Allowance is made, when counting errors, for the use of word processing software that automatically determines line length. The procedure for calculating keyboarding speed has also been clarified.

The need for the Standard stemmed from the fact that, although many employers hire staff or award pay increases on the basis of keyboarding speed, the tests to determine keyboarding speed have in the past varied widely, producing results that are not comparable. As a consequence, many employers conducted their own speed tests; however, it must be recognized that speed is not the only indicator of a keyboard operator's capability.

In preparing this edition, the committee agreed to retain the accepted practice of expressing keyboarding speed in words per minute, where a word is a standard unit consisting of a specific number of keystrokes. The number of keystrokes that should constitute a standard word, however, was an issue that provoked considerable discussion during the development of the previous editions.

Research conducted by L. J. West¹, D. J. Perry² and B. S. Ober³ indicated that the average word, including spaces and punctuation marks in written American business language contained respectively 5.97, 5.83 and 6.13 keystrokes. A study by the committee of 300 current Australian shorthand test passages, which had an average of 5.6 keystrokes per word, tended to support the assumption that Australian business language also had closer to 6 keystrokes per word than the commonly accepted 5. If a speed test was intended to measure actual keyboarding speed then the standard word should resemble as closely as possible the average word in current business language, i.e. 6 keystrokes.

On the other hand, many argued that the main purpose of a standard speed test was not necessarily to provide an accurate measure of speed, but rather to provide an effective ranking method. In that case the unit of measurement used was not as important as the fact that the unit should remain constant for each test. Also, considerable resources, both written and financial, have been invested in the development of a body of work based on the 5-stroke standard word. Finally, the 5-stroke standard word has been accepted both internationally and in Australia for many years. On these grounds, the committee acknowledged that to introduce a 6-stroke standard word in Australia, at this time, might cause unnecessary complications.

It should be noted that although the Standard retains a 5-stroke standard word, results achieved using this test method will not be comparable with results achieved using other test methods, because the keystrokes themselves are counted differently.

FOREWORD

Modern technology has necessitated several changes in the previously accepted rules of speed tests. The most obvious of these is the change from the concept of a speed test as a test in which error correction was not permitted to a test where corrections are permitted.

The change was brought about by the rapid replacement in the workplace of manual and electric typewriters by computer-based equipment, which allow quick and imperceptible correction of errors.

Although the Standard does not enable comparisons to be made between speeds achieved on different types of equipment, e.g. computers, electronic and manual typewriters, it will enable employers to confidently compare speeds achieved by different persons on particular equipment.

Reliability is also behind the separation in the Standard of the two distinct qualities, speed and accuracy enabling employers to distinguish between a fast, inaccurate keyboard operator and one who is slower but accurate.

Finally, examining bodies using this Standard should recognize that the Standard is a method only. The responsibility for designing, conducting, scoring and certifying speed tests remains with the examining body.

STANDARDS AUSTRALIA

Australian Standard Keyboarding speed tests (formerly known as 'Typing speed tests')

SECTION 1 SCOPE AND GENERAL

1.1 SCOPE

This Standard sets out a method for the conduct, assessment and certification of keyboarding speed and accuracy tests conducted in the English language.

The Standard does not deal with tests in the theory or application of keyboarding skills, nor does it prescribe correct techniques (e.g. keyboarding, touch typing).

1.2 APPLICATION

This Standard is intended for use by all bodies that conduct keyboarding speed tests.

1.3 REFERENCED DOCUMENTS

The following documents are referred to in this Standard:

AS

1680 Interior lighting

1680.1 Part 1: General principles and recommendations

1680.2.0 Part 2.0 Recommendations for specific tasks and interiors

1680.2.2 Part 2.2 Office and screen-based tasks

3590 Screen-based workstations

3590.2 Part 2: Workstation furniture

HB 10 Occupational overuse syndrome—Preventative guidelines

HB 59 Ergonomics—the human factor—A practical approach to work systems design

Style Manual for Authors, Editors and Printers (AGPS Press, Canberra)

1.4 DEFINITIONS

For the purpose of this Standard, the definitions below apply.

1.4.1 Automatic correction facility

A computer or software feature that can point out and correct common keyboarding, spelling or grammatical errors.

1.4.2 Equipment

Any device with a keyboard, such as a computer, or electronic, electric or manual typewriter, that can be used to print characters.

1.4.3 Examining body

An institution or group that devises, administers, assesses and certifies keyboarding speed tests in accordance with this Standard.

1.4.4 Font

A printing typeface of a particular style and size.
