

Australian Standard[®]

**VIBRATION AND SHOCK—
HAND-TRANSMITTED
VIBRATION—GUIDELINES FOR
MEASUREMENT AND
ASSESSMENT OF HUMAN
EXPOSURE**

This Australian Standard was prepared by Committee AV/10, Vibration and Shock—Human Effects. It was approved on behalf of the Council of the Standards Association of Australia on 1 August 1988 and published on 3 October 1988.

The following interests are represented on Committee AV/10:

Association of Australian Acoustical Consultants
Australian Coal Association
Australian Environment Council
Confederation of Australian Industry
Construction Equipment Importers and Manufacturers of Australia
CSIRO, National Measurement Laboratory
Department of Defence
Department of Industrial Relations and Employment (N.S.W.)
Federal Chamber of Automotive Industries
National Acoustic Laboratories
Railways of Australia Committee
Royal Institution of Naval Architects
University of Newcastle

Review of Australian Standards. To keep abreast of progress in industry, Australian Standards are subject to periodic review, and are kept up to date by the issue of amendments or new editions as necessary. It is important therefore that Standards users ensure that they are in possession of the latest edition, and any amendments thereto.

Full details of all Australian Standards and related publications will be found in the Standards Australia Catalogue of Publications; this information is supplemented each month by the magazine 'The Australian Standard', which subscribing members receive, and which gives details of new publications, new editions and amendments, and of withdrawn Standards.

Suggestions for improvements to Australian Standards, addressed to the head office of Standards Australia, are welcomed. Notification of any inaccuracy or ambiguity found in an Australian Standard should be made without delay in order that the matter may be investigated and appropriate action taken.

This Standard was issued in draft form for comment as DR 87291.

PREFACE

This Standard was prepared by the Association's Committee on Vibration and Shock—Effects, to supersede AS 2763-1985, *Vibration and shock—Hand-transmitted vibration—Measurement and medical screening*. It is aligned with ISO 5349, *Mechanical vibration—Guidelines for the measurement and the assessment of human exposure to hand-transmitted vibration*. The revised Standard incorporates guidelines for the evaluation of hand-transmitted vibration exposure in Appendix A.

Users of Standards are reminded that copyright subsists in all Standards Australia publications and software. Except where the Copyright Act allows and except where provided for below no publications or software produced by Standards Australia may be reproduced, stored in a retrieval system in any form or transmitted by any means without prior permission in writing from Standards Australia. Permission may be conditional on an appropriate royalty payment. Requests for permission and information on commercial software royalties should be directed to the head office of Standards Australia.

Standards Australia will permit up to 10 percent of the technical content pages of a Standard to be copied for use exclusively in-house by purchasers of the Standard without payment of a royalty or advice to Standards Australia.

Standards Australia will also permit the inclusion of its copyright material in computer software programs for no royalty payment provided such programs are used exclusively in-house by the creators of the programs.

Care should be taken to ensure that material used is from the current edition of the Standard and that it is updated whenever the Standard is amended or revised. The number and date of the Standard should therefore be clearly identified.

The use of material in print form or in computer software programs to be used commercially, with or without payment, or in commercial contracts is subject to the payment of a royalty. This policy may be varied by Standards Australia at any time.

FOREWORD

Intense vibration can be transmitted from vibrating tools, vibrating machinery or vibrating workpieces to the hands and arms of operators. Such situations occur, for example, when a person handles pneumatic and electric handtools and in forestry work when a person handles chainsaws. These vibrations are usually transmitted through the hand and arm to the shoulder. Depending on the situation, they can be transmitted to one arm only or to both arms simultaneously. The vibration of body parts and the perceived vibration are frequently the source of discomfort and possibly reduced proficiency. Continued, habitual use of many vibrating tools has been found to be connected with various patterns of diseases affecting the blood vessels, nerves, bones, joints, muscles, or connective tissues of the hand and forearm.

The vibration exposures required to cause these disorders are not known exactly with respect to vibration intensity and the vibration frequency spectrum or with respect to daily exposure time and the total exposure period. Collection of reliable data on how vibration exposure affects human health has proved to be extremely difficult for many reasons. In view of the complexity of the problem and the paucity of quantitative data concerning the occupational health effect of hand-transmitted vibration, it is difficult to propose a firm Standard regarding the evaluation of such vibration and to recommend limits for safe exposure, particularly in relationship to problems other than vibration white finger (VWF).

In view of the complexity of the problem and the shortage of quantitative data concerning the occupational health effect of hand-transmitted vibration, it is difficult to propose a comprehensive method for assessing vibration exposure. However, based on the limited data available and on experience with current exposure conditions, the information in this Standard represents the best guidance available to protect the majority of workers against serious health impairment and to assist in the development of hand-operated tools the use of which will reduce the risk of vibration induced disorders.

STANDARDS ASSOCIATION OF AUSTRALIA

Australian Standard

**VIBRATION AND SHOCK—HAND-TRANSMITTED VIBRATION—
GUIDELINES FOR MEASUREMENT AND ASSESSMENT OF HUMAN EXPOSURE**

SECTION 1. SCOPE AND GENERAL

1.1 SCOPE. This Standard sets out general methods for measuring and reporting hand-transmitted vibration exposure in three orthogonal axes for the one-third octave bands having centre frequencies from 6.3 Hz to 1250 Hz, for octave bands having centre frequencies from 8 Hz to 1000 Hz, and for a frequency-weighted measure covering the frequency range from 5.6 Hz to 1400 Hz.

This Standard provides guidance for the evaluation of hand-transmitted vibration specified in terms of a frequency-weighted vibration acceleration and daily exposure time. It does not define the limits of safe exposure. This guidance is derived from a consensus of opinion based upon data available from both practical experience and laboratory experimentation concerning human response to hand-transmitted vibration. It cannot be taken to define completely safe exposure ranges in which vibration diseases cannot occur.

This Standard does not specify the risk factor of health impairment for different operational processes, tools, and machines.

NOTE: Reference should be made to AS 2973 for information related to vibration-measuring instrumentation.

1.2 APPLICATION. This Standard applies to periodic and to random or non-periodic vibration. Provisionally, this Standard may also be applied to repeated shock type excitation.

NOTE: To facilitate further progress in this field and to allow the quantitative comparison of exposure data, uniform methods for measuring and reporting exposure of human beings to hand-transmitted vibration are desirable. Additional Standards are to be considered for the vibration measurement of specific tools and processes.

Appendix A provides guidelines for the evaluation of hand-transmitted vibration exposures.

Appendix B outlines measures that should be adopted to medically screen people who are either involved or propose becoming involved with hand-transmitted vibration in their occupation. This Appendix also explains some techniques that will normally be useful in reducing the severity of hand-transmitted vibration and the incidence of vibration-induced physiological signs of damage to the hands.

1.3 REFERENCED DOCUMENTS. The documents below are referred to in this Standard.

AS	
2670	Vibration and shock—Guide to the evaluation of human exposure to whole-body vibration
2775	Vibration and shock—Mechanical mounting of accelerometers
2973	Vibration and shock—Human response vibration-measuring instrumentation
Z41	Octave, half octave and one-third octave band pass filters intended for the analysis of sound and vibrations
IEC	
184	Methods for specifying the characteristics of electro-mechanical transducers for shock and vibration measurements
222	Methods for specifying the characteristics of auxiliary equipment for shock and vibration measurement
ISO	
5805	Mechanical vibration and shock affecting man—Vocabulary
DIS	
5347	Methods for the calibration of vibration and shock pick-ups
8041	Human response vibration measuring instrumentation
