**ACOUSTICS—METHODS OF  
ASSESSING AND PREDICTING  
SPEECH PRIVACY AND SPEECH  
INTELLIGIBILITY**

---

This Australian standard was prepared by Committee AK/4. It was approved on behalf of the Council of the Standards Association of Australia on 20 August 1985 and published on 4 November 1985.

---

The following interests are represented on Committee AK/4:

Association of Australian Acoustical Consultants  
Australian Acoustical Society  
Confederation of Australian Industry  
CSIRO Division of Building Research  
Department of Employment and Industrial Relations  
Department of Public Works  
Experimental Building Station  
Institution of Engineers Australia  
Public Works Department, W.A.  
Royal Australian Institute of Architects  
Royal Melbourne Institute of Technology  
State Pollution Control Commission, N.S.W.  
University of Adelaide  
University of Sydney

---

**Review of Australian Standards.** To keep abreast of progress in industry, Australian Standards are subject to periodic review and are kept up to date by the issue of amendments or new editions as necessary. It is important, therefore, that Standards users ensure that they are in possession of the latest edition, and any amendments thereto.

Full details of all Australian Standards and related publications will be found in the Standards Australia Catalogue of Publications; this information is supplemented each month by the magazine 'The Australian Standard', which subscribing members receive, and which gives details of new publications, new editions and amendments, and of withdrawn Standards.

Suggestions for improvements to Australian Standards, addressed to the head office of Standards Australia, are welcomed. Notification of any inaccuracy or ambiguity found in an Australian Standard should be made without delay in order that the matter may be investigated and appropriate action taken.

---

*This Standard was issued in draft form for comment as DR 81312.*

## PREFACE

This standard was prepared by the Association's Committee on Architectural Acoustics. It describes objective and subjective methods of estimating speech intelligibility and predicting speech privacy and applies to the determination of speech intelligibility in auditoriums, class rooms, lecture rooms, conference rooms, etc, and speech privacy conditions in offices, conference rooms, hotels, motels, dwellings, and schools.

The results obtained using the methods in this standard should be used with caution because of their limitations.

During the preparation of this standard reference was made to ANSI S3.14—1977, Rating Noise With Respect to Speech Interference.

### © Copyright — STANDARDS AUSTRALIA

Users of Standards are reminded that copyright subsists in all Standards Australia publications and software. Except where the Copyright Act allows and except where provided for below no publications or software produced by Standards Australia may be reproduced, stored in a retrieval system in any form or transmitted by any means without prior permission in writing from Standards Australia. Permission may be conditional on an appropriate royalty payment. Requests for permission and information on commercial software royalties should be directed to the head office of Standards Australia.

Standards Australia will permit up to 10 percent of the technical content pages of a Standard to be copied for use exclusively in-house by purchasers of the Standard without payment of a royalty or advice to Standards Australia.

Standards Australia will also permit the inclusion of its copyright material in computer software programs for no royalty payment provided such programs are used exclusively in-house by the creators of the programs.

Care should be taken to ensure that material used is from the current edition of the Standard and that it is updated whenever the Standard is amended or revised. The number and date of the Standard should therefore be clearly identified.

The use of material in print form or in computer software programs to be used commercially, with or without payment, or in commercial contracts is subject to the payment of a royalty. This policy may be varied by Standards Australia at any time.

ACOUSTICS—METHODS OF ASSESSING AND PREDICTING SPEECH  
PRIVACY AND SPEECH INTELLIGIBILITY

## FOREWORD

Speech intelligibility and privacy depend on many factors, including acoustic factors, such as—

- (a) the level of the speech signal, its frequency spectrum;
- (b) space characteristics, such as reverberation and ambient sound level;
- (c) non-acoustic factors, such as the type of message, talker and listener characteristics, choice of test material, etc; and
- (d) random and quasi-random factors, such as individual differences between talkers and listeners, the effect of randomization of speech test material, etc.

Because of the above factors, caution should be exercised in the application of this standard and the results therefrom.

The following objective and subjective methods of predicting or assessing speech communication and speech privacy are described in this standard:

- (i) *Objective methods of predicting speech communication.*
  - A. Determination of the speech interference level (*SIL*) of an ambient sound and relating this to the maximum distance over which it is estimated that reliable speech communication may take place.
  - B. Determination of the overall ambient sound pressure level, in decibels(A), and relating this to the maximum distance over which it is estimated that reliable speech communication may take place.
  - C. Determination or prediction of the articulation index (*AI*) and relating this to the possibility of understanding connected speech.
- (ii) *Subjective method of assessing speech communication.* Direct measurement of the percentage speech intelligibility (*SI*) using a test crew of talkers and listeners and selected speech material and relating this to the possibility of understanding connected speech.
- (iii) *Objective method of predicting speech privacy.* Prediction of the estimated acceptability of the acoustic environment with respect to speech privacy, account being taken of such factors as vocal effort, source and receiving area characteristics, transmission between source and receiving area, and ambient sound pressure level in the receiving area.
- (iv) *Subjective method of assessing speech privacy.* Direct measurement of the percentage speech intelligibility (*SI*) using a test crew of talkers and listeners and selected speech material, and relating this to the articulation index (*AI*) and thence to an assessment of the degree of speech privacy.

The acceptability of a speech communication/privacy condition depends on the conditions being investigated and in particular on the type of message being communicated. The greater the redundancy of information content in an ensemble of messages, the greater will be the intelligibility of communication in a particular acoustic environment. Conversely, lack of familiarity with a language, or with the vocabulary used on the part of the talker and/or listener, or the presence of a hearing disability in the listener, will have a significant effect on the acceptability or otherwise of a communication environment.

Generally speech levels vary widely for different talkers and a standard deviation of 6 dB is typical, thus both speech communication and speech privacy may be significantly altered according to the individual talker's speech level. Speech communication is also affected by the clarity of enunciation and speed of delivery of individual talkers. For speech privacy, the nature of the task performed by the listener will also affect the acceptability of the situation.
