

Australian Standard®

Information processing systems—

**Open Systems Interconnection—
Internal organization of the
network layer**

This Australian Standard was prepared by Committee IS/1, Information Processing Systems. It was approved on behalf of the Council of Standards Australia on 2 November 1988 and published on 13 February 1989.

The following interests are represented on Committee IS/1:

Australian Association of Permanent Building Societies
Australian Bankers' Association
Australian Bureau of Statistics
Australian Computer Equipment Manufacturers Association
Australian Computer Society
Australian Computer Users Association
Australian Computing Services Association
Australian Information Industry Association
CSIRO
CSIRONET
Department of Defence
Department of Industry, Technology and Commerce
Life Insurance Federation of Australia
Public Service Board, N.S.W.
Telecom Australia
Universities and colleges

Review of Australian Standards. To keep abreast of progress in industry, Australian Standards are subject to periodic review and are kept up to date by the issue of amendments or new editions as necessary. It is important therefore that Standards users ensure that they are in possession of the latest edition, and any amendments thereto.

Full details of all Australian Standards and related publications will be found in the Standards Australia Catalogue of Publications; this information is supplemented each month by the magazine 'The Australian Standard', which subscribing members receive, and which gives details of new publications, new editions and amendments, and of withdrawn Standards.

Suggestions for improvements to Australian Standards, addressed to the head office of Standards Australia, are welcomed. Notification of any inaccuracy or ambiguity found in an Australian Standard should be made without delay in order that the matter may be investigated and appropriate action taken.

PREFACE

This Standard was prepared by the Standards Australia Committee on Information Processing Systems. It is identical with and has been reproduced from International Standard ISO 8648—1988.

This Standard provides an architectural model of the OSI Network Layer as a framework for OSI Network Layer standardization, allowing incorporation of existing networks within the OSI architecture.

This framework encourages the design of real subnetworks that fully support the OSI Network Service whilst accommodating the participation, in the OSI environment, of other subnetworks that do not fully support the OSI Network Service.

This Standard is intended for use both in the design and application of Network Layer protocols, operating between network-entities either in end systems providing the OSI Network Service, or in intermediate systems providing the routing and relay functions.

The organization defined herein does not address Network Layer management. In particular it is not concerned with the relationships among Network Layer entities which may be required for Network Layer management purposes. In addition, this Standard does not specify the operational requirements for relay functions in intermediate systems, nor address how specific combinations of permitted functions might be practically and efficiently utilized.

The Standard is one of a series of Open Systems Interconnection (OSI) Standards which are currently under development. Since OSI Standards are developmental, there may be some minor difficulties encountered in their implementation. For this reason, Standards Australia will be providing a limited interpretation service to coordinate and disseminate information concerning difficulties which are identified in using this Standard.

For the purpose of this Australian Standard, the text of the ISO Standard given herein should be modified as follows:

- (a) *Terminology.* The words 'Australian Standard' should replace the words 'International Standard' wherever they appear.
- (b) *References.* The references to International Standards should be replaced by references to Australian Standards as follows:

Users of Standards are reminded that copyright subsists in all Standards Australia publications and software. Except where the Copyright Act allows and except where provided for below no publications or software produced by Standards Australia may be reproduced, stored in a retrieval system in any form or transmitted by any means without prior permission in writing from Standards Australia. Permission may be conditional on appropriate royalty payment. Requests for permission and information on commercial software royalties should be directed to the head office of Standards Australia.

Standards Australia will permit up to 10 percent of the technical content pages of a Standard to be copied for use exclusively in-house by purchasers of the Standard without payment of a royalty or advice to Standards Australia.

Standards Australia will also permit the inclusion of its copyright material in computer software programs for no royalty payment provided such programs are used exclusively in-house by the creators of the programs.

Care should be taken to ensure that material used is from the current edition of the Standard and that it is updated whenever the Standard is amended or revised. The number and date of the Standard should therefore be clearly identified.

The use of material in print form or in computer software programs to be used commercially, with or without payment, or in commercial contracts is subject to the payment of a royalty. This policy may be varied by Standards Australia at any time.

Information processing systems—Open Systems Interconnection—Internal organization of the network layer

0 Introduction

This International Standard defines an architectural organization of the Network Layer of the OSI Reference Model. It is concerned with the functional organization of Network Layer entities in open systems, and with the ways in which this organization can be mapped to “real world” components (e.g. “real” networks, switches, transmission media, etc.). This International Standard relates those “real world” objects which must be dealt with to a set of abstract elements. There may be a variety of mappings between an abstract element and the physical equipment used to realize it. The description of such mappings requires a clear distinction between architectural terms and real world terms.

The architectural organization defined in this International Standard identifies and categorizes the way in which functions can be performed within the Network Layer by Network Layer protocols. In so doing, it provides a uniform framework for describing how different Network Layer protocols, operating either individually or cooperatively, can be used to provide the OSI Network Service. By focusing attention on the common functional elements of Network Layer protocols, this framework is intended to

- a) simplify the use of Network Layer protocols to provide the Network Service in different situations;
- b) limit the uncoordinated proliferation of Network Layer protocols with overlapping functions; and
- c) clarify the requirements for, and guide the development of, future Network Layer protocol standards.

This detailed internal structure is necessary in the case of the Network Layer for two reasons:

1. The Network Layer provides its users with a uniform Network Service, regardless of potentially wide variations in underlying “real-world” network services, technologies, and administrative organization. It is important to understand how the underlying components are organized and interact within the Network Layer, and how they can be efficiently and effectively used.
2. ISO 7498 specifies that the Network Layer performs routing and relaying functions and may contain entities residing in intermediate systems as well as in end systems. It is necessary to describe

events that take place within the Network Layer in both types of entities; i.e. in end systems (within which the Network Service is provided to NS users) and in intermediate systems (within which network entities providing these relay and routing functions do not provide the Network Service to NS users).

1 Scope and field of application

This International Standard provides an architectural model of the OSI Network Layer as a framework for OSI Network Layer standardization, allowing incorporation of existing networks within the OSI architecture.

This framework encourages the design of real subnetworks that fully support the OSI Network Service whilst accommodating the participation, in the OSI environment, of other subnetworks that do not fully support the OSI Network Service.

This International Standard is intended for use both in the design and application of Network Layer protocols, operating between network-entities either in end systems providing the OSI Network Service, or in intermediate systems providing the routing and relay functions.

It shall be used to

- a) provide a common set of concepts and terminology for use in Network Layer standards (such standards shall reference this International Standard);
- b) analyse Network Layer functionality and classify Network Layer protocols;
- c) specify how “real networks” should be used in supporting or providing the OSI Network Service, in particular, in circumstances where multiple “real networks” are to be interconnected and used.

The organization defined herein does not address Network Layer management; in particular it is not concerned with the relationships among Network Layer entities which may be required for Network Layer management purposes. In addition, this International Standard does not specify the operational requirements for relay functions in intermediate systems, nor address how specific combinations of permitted functions might be practically and efficiently utilized.
