Australian Standard®

**Electromechanical components for
electronic equipment—Basic testing
procedures and measuring methods**

**Part 8: Connector tests
(mechanical) and mechanical tests
on contacts and terminations**

This Australian Standard was prepared by Committee ET/5, Environmental Testing Procedures. It was approved on behalf of the Council of Standards Australia on 5 June 1989 and published on 6 November 1989.

The following interests are represented on Committee ET/5:

Aerospace Technologies of Australia
Confederation of Australian Industry
Department of Administrative Services
Department of Defence
Electricity Supply Association of Australia
Institution of Engineers, Australia
National Association of Testing Authorities
Society of Automotive Engineers, Australasia
Telecom Australia
University of New South Wales

Review of Australian Standards. To keep abreast of progress in industry, Australian Standards are subject to periodic review and are kept up-to-date by the issue of amendments or new editions as necessary. It is important therefore that Standards users ensure that they are in possession of the latest edition, and any amendments thereto.

Full details of all Australian Standards and related publications will be found in the Standards Australia Catalogue of Publications; this information is supplemented each month by the magazine 'The Australian Standard', which subscribing members receive, and which gives details of new publications, new editions and amendments, and of withdrawn Standards.

Suggestions for improvements to Australian Standards, addressed to the head office of Standards Australia, are welcomed. Notification of any inaccuracy or ambiguity found in an Australian Standard should be made without delay in order that the matter may be investigated and appropriate action taken.

**Part 8: Connector tests
(mechanical) and mechanical tests
on contacts and terminations**

First published as AS 3726.8—1989.

PREFACE

This Standard was prepared by the Standards Australia Committee on Environmental Testing Procedures. It is identical with and reproduced from IEC 512-8 (1984) as amended by Amendment No 1, issued by the IEC.

The purpose of Part 8 is to specify uniform tests for connectors to assess the ability of the contact retaining system and the insert retaining system to withstand axial and torsional forces; to insert and withdraw contacts, and to maintain engagement of mated connectors. Methods are given to assess probe damage to female connectors; to assess the tensile strength of crimped connectors; to measure the holding capability of resilient contacts, and to assess the ability of terminations to withstand mechanical stresses. Further methods are included which assess the ability of contacts to withstand the crimping operation; to hold an insulation grip on cables and grounding contact springs, and to determine the force necessary to strip a wrapped connection from a post.

The page numbers of the IEC English text are given on the bottom left hand corner of each page of this Standard.

For the purpose of this Australian Standard the text of the IEC Standard used herein should be modified as follows:

- (a) *Terminology*: The words 'Australian Standard' should replace the word 'IEC Publication' wherever they appear.
- (b) *References*: The references to international Standards should be replaced by references to Australian Standards as follows:

SECTION ONE — CONNECTOR TESTS (MECHANICAL)

Clause

1. Test 15a: Contact retention in insert	4
2. Test 15b: Insert retention in housing (axial)	5
3. Test 15c: Insert retention in housing (torsional)	6
4. Test 15d: Contact insertion, release and extraction force	7
5. Test 15e: Grounding contact ring holding force (deleted)	8
6. Test 15f: Effectiveness of connector coupling devices	10

SECTION TWO — MECHANICAL TESTS ON CONTACTS AND TERMINATIONS

8. Test 16a: Probe damage	11
9. Test 16b: Restricted entry	12
10. Test 16c: Contact bending strength	13
11. Test 16d: Tensile strength (crimped connection)	14
12. Test 16e: Gauge retention force (resilient contacts)	15
13. Test 16f: Robustness of terminations	16
14. Test 16g: Measurement of contact deformation after crimping	16
15. Test 16h: Insulation grip effectiveness (crimped connections)	18
16. Test 16i: Grounding contact spring holding force	20
18. Test 16k: Stripping force, solderless wrapped connections	21
19. Test 16m: Unwrapping, solderless wrapped connections	22
20. Test 16n: Bending strength, fixed male tabs	23
21. Test 16p: Torsional strength, fixed male tabs	24
22. Test 16q: Tensile and compressive strength, fixed male tabs	26

STANDARDS AUSTRALIA

Australian Standard

Electromechanical components for electronic equipment—Basic
testing procedures and measuring methodsPart 8: Connector tests (mechanical) and mechanical tests on con-
tacts and terminations**Scope**

The tests contained herein, when required by the detail specification, shall be used for electro-mechanical components within the scope of Technical Committee No. 48*. They may also be used for similar devices when specified in a detail specification.

SECTION ONE — CONNECTOR TESTS (MECHANICAL)

1. Test 15a: Contact retention in insert

1.1 *Object*

The object of this test is to detail a standard method to assess the ability of the contact retaining system to withstand the axial mechanical stresses likely to be encountered during normal usage.

1.2 *Preparation of the specimen*

The specimen shall consist of a component with all contacts installed in accordance with the detail specification:

Loosen or remove any accessories which are not essential for the contact retaining system.

1.3 *Test method*

Select 20% of the contacts (but not less than six contacts) at random for the test. At least one contact shall be near the periphery and one near the centre of the component. For component having six contacts or less, all contacts shall be used for the test.

* *Scope of Technical Committee No. 48:* To prepare international standards regarding components having an inherent electromechanical connecting or switching function, intended for use in equipment for telecommunication and in electronic devices employing similar techniques.

Notes 1. — R.F. connectors will not be dealt with by this Technical Committee as they will be covered by Technical Committee No. 46 together with r.f. cables.

2. — Sockets for components such as crystals or electronic tubes should be considered in co-operation with the relevant Technical Committee.
