

Australian Standard[®]

**Customer/utility information
exchange**

**Part 1: System architecture
and functionality**

This Australian Standard was prepared by Committee TE/18, Customer Metering and Services Interfaces. It was approved on behalf of the Council of Standards Australia on 17 January 1995 and published on 5 May 1995.

The following interests are represented on Committee TE/18:

Agriculture and Resource Management Council of Australia and New Zealand
Association for Metering and Customer Services
Australian Chamber of Commerce and Industry
Australian Electrical and Electronic Manufacturers Association
Australian Gas Association
Australian Information Industry Association
Electricity Supply Association of Australia
Telecom Australia
University of Ballarat

Review of Australian Standards. To keep abreast of progress in industry, Australian Standards are subject to periodic review and are kept up to date by the issue of amendments or new editions as necessary. It is important therefore that Standards users ensure that they are in possession of the latest edition, and any amendments thereto.

Full details of all Australian Standards and related publications will be found in the Standards Australia Catalogue of Publications; this information is supplemented each month by the magazine 'The Australian Standard', which subscribing members receive, and which gives details of new publications, new editions and amendments, and of withdrawn Standards.

Suggestions for improvements to Australian Standards, addressed to the head office of Standards Australia, are welcomed. Notification of any inaccuracy or ambiguity found in an Australian Standard should be made without delay in order that the matter may be investigated and appropriate action taken.

Australian Standard[®]

**Customer/utility information
exchange**

**Part 1: System architecture
and functionality**

PREFACE

This Standard was prepared by the Standards Australia Committee on Customer Metering and Services Interfaces to supersede AS 4141.1(Int)—1993.

The objective of this Standard is to provide the utility metering industry with details of the architecture and functionality of a system that will provide for ready interconnection of the various elements in a system of information exchange between utilities and customers, including provision for automatic meter reading, load control, value-added customer services and system control automation.

This edition incorporates minor editorial improvements.

This Standard is Part 1 of AS 4141, *Customer/utility information exchange*, which is published in Parts as follows:

Part 1: System architecture and functionality

Part 2: Applications and performance

Part 3: Customer premises interfaces

Other Parts are under consideration.

Users of Standards are reminded that copyright subsists in all Standards Australia publications and software. Except where the Copyright Act allows and except where provided for below no publications or software produced by Standards Australia may be reproduced, stored in a retrieval system in any form or transmitted by any means without prior permission in writing from Standards Australia. Permission may be conditional on an appropriate royalty payment. Requests for permission and information on commercial software royalties should be directed to the head office of Standards Australia.

Standards Australia will permit up to 10 percent of the technical content pages of a Standard to be copied for use exclusively in-house by purchasers of the Standard without payment of a royalty or advice to Standards Australia.

Standards Australia will also permit the inclusion of its copyright material in computer software programs for no royalty payment provided such programs are used exclusively in-house by the creators of the programs.

Care should be taken to ensure that material used is from the current edition of the Standard and that it is updated whenever the Standard is amended or revised. The number and date of the Standard should therefore be clearly identified.

The use of material in print form or in computer software programs to be used commercially, with or without payment, or in commercial contracts is subject to the payment of a royalty. This policy may be varied by Standards Australia at any time.

STANDARDS AUSTRALIA

Australian Standard

Customer/utility information exchange

Part 1: System architecture and functionality

1 SCOPE This Standard specifies the communications architecture and functionality for customer/utility information exchange (CUIE) for a utility, a combined utility, or a group of utilities. It defines the interfaces and protocols that will enable a two-way metering, control and monitoring system to be implemented, with equipment from a variety of manufacturers, providing the maximum degree of compatibility but without stifling innovation and technological development. Most facilities mentioned in this Standard entail wide area two-way communications.

This Standard specifies the type and quantity of information that may be required to be transmitted across the communications network for present and future systems particularly in relation to the following aspects:

- (a) Remote reading of customer electricity, gas and water meters.
- (b) Remote setting of tariffs at the customer premises equipment (CPE).
- (c) Remote control of some or all of the customer load/supply.
- (d) Remote monitoring of quality of service provided to the customer.
- (e) Display of information including electricity, gas and water bills, tariffs and quantities at the customer premises, and provision of other customer service facilities such as remote supply connect/disconnect.
- (f) Provision of appropriate alarm and status information.
- (g) Transmission of messages between a service provider and the customer for value added services (VAS).
- (h) Limited distribution system automation (DSA) not provided by high performance supervisory control and data acquisition (SCADA) systems.

This Standard is not intended to limit the flexibility available to a utility in its choice of media. For example, combinations of the following media may be used to suit various applications and performance requirements (the listing is not exhaustive):

- (i) Distribution line carrier (DLC).
- (ii) Power line carrier (PLC).
- (iii) Manual signalling.
- (iv) Public Switched Telephone Network (PSTN).
- (v) Integrated Services Digital Network (ISDN).
- (vi) Radio.
- (vii) Satellite.
- (viii) Cable television.
- (ix) Optical fibre.

This Standard does not cover the realization for the metering and control devices, hand-held unit or home automation bus at the customer premises, nor the realization for the operating/control equipment in DSA applications.
