# Carbon dioxide capture, transportation and geological storage — Carbon dioxide storage using enhanced oil recovery (CO<sub>2</sub>-EOR)

currently in review, click buy full version

AS ISO 27916:2020

This Australian Standard® was prepared by EE-002, Carbon dioxide capture, transportation, and geological storage. It was approved on behalf of the Council of Standards Australia on 20 October 2020.

This Standard was published on 30 October 2020.

The following are represented on Committee EE-002:

Australian Industry Group  
Australian National Low Emissions Coal R&D  
Australian Petroleum Production and Exploration Association  
CSIRO  
Department for Energy and Mining, SA  
Department of Mines, Industry Regulation and Safety, WA  
Engineers Australia  
Geoscience Australia  
Petroleum Exploration Society of Australia, Vic.

This Standard was issued in draft form for comment as DR AS ISO 27916:2020.

## Preface

This Standard was prepared by the Standards Australia Committee EE-002, Carbon dioxide capture, transportation, and geological storage.

The objective of this document is to specify requirements for the quantifying and documenting of carbon dioxide (CO<sub>2</sub>) that is injected in enhanced recovery operations for oil and other hydrocarbons (CO<sub>2</sub>-EOR) for which quantification of CO<sub>2</sub> that is safely stored long-term in association with the CO<sub>2</sub>-EOR project is sought. Recognizing that some CO<sub>2</sub>-EOR projects use non-anthropogenic CO<sub>2</sub> in combination with anthropogenic CO<sub>2</sub>, the document also shows how allocation ratios could be utilized for optional calculations of the anthropogenic portion of the associated stored CO<sub>2</sub> (see Annex B).

This document does not apply to quantification of CO<sub>2</sub> injected into reservoirs where no hydrocarbon production is anticipated or occurring. Storage of CO<sub>2</sub> in geologic formations that do not contain hydrocarbons is covered by AS ISO 27914:2019 even if located above or below hydrocarbon producing reservoirs. If storage of CO<sub>2</sub> is conducted in a reservoir from which hydrocarbons were previously produced but will no longer be produced in paying or commercial quantities, or where the intent of CO<sub>2</sub> injection is not to enhance hydrocarbon recovery, such storage would also be subject to the requirements of AS ISO 27914:2019.

The conceptual boundary of this document for CO<sub>2</sub> stored in association with CO<sub>2</sub>-EOR includes—

- (a) safe, long-term containment of CO<sub>2</sub> within the EOR complex;
- (b) CO<sub>2</sub> leakage from the EOR complex through leakage pathways; and
- (c) on-site CO<sub>2</sub>-EOR project loss of CO<sub>2</sub> from wells, equipment or other facilities.

This document does not include the following:

- (i) Lifecycle emissions, including but not limited to CO<sub>2</sub> emissions from capture or transportation of CO<sub>2</sub>, on-site emissions from combustion or power generation, and CO<sub>2</sub> emissions resulting from the combustion of produced hydrocarbons.
- (ii) Storage of CO<sub>2</sub> above ground.
- (iii) Buffer and seasonal storage of CO<sub>2</sub> below ground (similar to natural gas storage).
- (iv) Any technique or product that does not involve injection of CO<sub>2</sub> into the subsurface.
- (v) Emissions of any GHGs other than CO<sub>2</sub>.

NOTE Some authorities might require other GHG components of the CO<sub>2</sub> stream to be quantified.

This document is identical with, and has been reproduced from, ISO 27916:2019, *Carbon dioxide capture, transportation and geological storage — Carbon dioxide storage using enhanced oil recovery (CO<sub>2</sub>-EOR)*.

As this document has been reproduced from an International Standard, a full point substitutes for a comma when referring to a decimal marker.

Australian or Australian/New Zealand Standards that are identical adoptions of international normative references may be used interchangeably. Refer to the online catalogue for information on specific standards.

The terms “normative” and “informative” are used in Standards to define the application of the appendices or annexes to which they apply. A “normative” appendix or annex is an integral part of a Standard, whereas an “informative” appendix or annex is only for information and guidance.

## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see [www.iso.org/directives](http://www.iso.org/directives)).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see [www.iso.org/patents](http://www.iso.org/patents)).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: [www.iso.org/iso/foreword.html](http://www.iso.org/iso/foreword.html).

This document was prepared by Technical Committee ISO/TC 265, *Carbon dioxide capture, transportation, and geological storage*.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at [www.iso.org/members.html](http://www.iso.org/members.html).

## Introduction

This is the first edition of the standard entitled: *Carbon dioxide capture, transportation and geological storage — Carbon dioxide storage using enhanced oil recovery (CO<sub>2</sub>-EOR)*. The subject matter of this document is a new work product and does not cancel or replace any other documents in whole or in part related to the subject of CO<sub>2</sub>-EOR.

Carbon dioxide enhanced oil recovery (CO<sub>2</sub>-EOR) is a technique for increasing the recovery of hydrocarbons from an oil field.

The process involves using wells to inject volumes of CO<sub>2</sub> at pressures where the injected CO<sub>2</sub> usually mixes with the oil, changing the properties of the oil and enabling it to flow more freely to production wells. In most cases, a CO<sub>2</sub>-EOR project is designed as a closed-loop system whereby some of the injected CO<sub>2</sub> is co-produced with the oil and then separated in above-ground recycling facilities prior to being reinjected into the oil reservoir. CO<sub>2</sub> that is injected into the project reservoir is contained as an inherent element of the injection and production operations, and this document requires that such containment be demonstrated. CO<sub>2</sub> that is injected and remains trapped in the project reservoir (or EOR complex) during and after oil production activities is not released to the atmosphere, and this trapping is referred to as “associated storage”. [Annex A](#) provides a detailed description of the CO<sub>2</sub>-EOR process as presently used (and potential “next generation” uses) and the associated storage that occurs as an intrinsic part of those operations. Although methane is often present in EOR project reservoirs, this document does not specifically address methane or other greenhouse gases. The demonstration requirements for safe, long-term containment, however, address assessment of trapping and potential leakage pathways that would likely assure containment of methane as well as CO<sub>2</sub>. As detailed in [Annex A](#), CO<sub>2</sub>-EOR has been deployed internationally for several decades and has potential to expand. CO<sub>2</sub>-EOR is commercially valuable today because it allows for the additional recovery of hydrocarbon resources while simultaneously trapping injected CO<sub>2</sub> for safe, long-term containment as a part of the process.

This document applies to quantifying and documenting the total CO<sub>2</sub> (and optionally the anthropogenic portion of the CO<sub>2</sub>) that is stored in association with CO<sub>2</sub>-EOR. The document recognizes that CO<sub>2</sub>-EOR is principally an oil recovery operation. Associated with this oil recovery, however, safe and long-term CO<sub>2</sub> storage occurs. The absence of an accepted standard for demonstrating the safe, long-term containment of CO<sub>2</sub> in association with CO<sub>2</sub>-EOR and documenting the quantity of associated stored CO<sub>2</sub> constitutes one of the barriers to the increased use of anthropogenic CO<sub>2</sub> in CO<sub>2</sub>-EOR operations. The purpose of this document is to remove that barrier and thereby facilitate the exchange of goods and services related to the increased use and emissions reductions through associated storage by providing methods for demonstrating the safe, long-term containment of, and determining the quantity of CO<sub>2</sub> stored in association with CO<sub>2</sub>-EOR. The document does not address the financial consequences that may or may not result from documenting storage of CO<sub>2</sub> in association with CO<sub>2</sub>-EOR operations.

This document does not provide requirements for the selection, characterization or permitting of sites for CO<sub>2</sub>-EOR projects because those sites are selected, characterized, and permitted pursuant to requirements and standards applicable to oil and gas exploration and production. Likewise, this document does not specify environment, health and safety protections or corrective action and mitigation requirements that are provided by the regulations and standards applicable to all hydrocarbon production operations. (A list of many of the existing standards applicable to CO<sub>2</sub> injection wells and oil and gas operations is presented in the Bibliography.) This document does provide requirements for demonstrating that the site in question is adequate to provide safe, long-term containment of CO<sub>2</sub>, for demonstrating that the CO<sub>2</sub> flood is operated in a way to assure containment of the CO<sub>2</sub> in the EOR complex, and for quantifying associated storage.

This document provides for the quantification of the CO<sub>2</sub> that is stored in association with CO<sub>2</sub>-EOR operations. The results of quantifications under this document could be used as input for calculations conducted in accordance with a number of other standards, protocols or programs for the quantification or reporting of greenhouse gas emissions, mitigation, or reductions, including those complying with ISO 14064-1, ISO 14064-2 and ISO 14064-3. Specifically, this document provides for the identification and quantification of CO<sub>2</sub> losses (including fugitive emissions) and quantification of the amount of CO<sub>2</sub>

stored in association with CO<sub>2</sub>-EOR projects. Such quantification could be used in a broader scheme for the quantification and verification of emissions and emission reductions over the entire carbon capture, transportation and storage chain. Specifically, using this document will provide quantification results that could be used as input to approaches described in ISO/TR 27915 for Quantification & Verification (Q&V). In addition, the quantification of CO<sub>2</sub> stored in association with a CO<sub>2</sub>-EOR project pursuant to this document could be combined with the quantifications generated under ISO 27920, Carbon dioxide capture, transportation, and geological storage — Quantification and Verification, which is currently under development. The quantification of the storage associated with a CO<sub>2</sub>-EOR project that occurs as part of a CCS project chain could be combined with the quantification of one or more capture, transportation and geological storage systems to produce a total quantification for the entire CCS project chain. Under some emissions quantification and reporting regimes, CO<sub>2</sub> quantities stored in association with CO<sub>2</sub>-EOR are either treated as not emitted and excluded from calculations or subtracted as offsets.

## Carbon dioxide capture, transportation and geological storage — Carbon dioxide storage using enhanced oil recovery (CO<sub>2</sub>-EOR)

### 1 Scope

#### 1.1 Applicability

This document applies to carbon dioxide (CO<sub>2</sub>) that is injected in enhanced recovery operations for oil and other hydrocarbons (CO<sub>2</sub>-EOR) for which quantification of CO<sub>2</sub> that is safely stored long-term in association with the CO<sub>2</sub>-EOR project is sought. Recognizing that some CO<sub>2</sub>-EOR projects use non-anthropogenic CO<sub>2</sub> in combination with anthropogenic CO<sub>2</sub>, the document also shows how allocation ratios could be utilized for optional calculations of the anthropogenic portion of the associated stored CO<sub>2</sub> (see [Annex B](#)).

#### 1.2 Non-applicability

This document does not apply to quantification of CO<sub>2</sub> injected into reservoirs where no hydrocarbon production is anticipated or occurring. Storage of CO<sub>2</sub> in geologic formations that do not contain hydrocarbons is covered by ISO 27914 even if located above or below hydrocarbon producing reservoirs. If storage of CO<sub>2</sub> is conducted in a reservoir from which hydrocarbons were previously produced but will no longer be produced in paying or commercial quantities, or where the intent of CO<sub>2</sub> injection is not to enhance hydrocarbon recovery, such storage would also be subject to the requirements of ISO 27914.

#### 1.3 Standard boundary

##### 1.3.1 Inclusions

The conceptual boundary of this document for CO<sub>2</sub> stored in association with CO<sub>2</sub>-EOR includes:

- a) safe, long-term containment of CO<sub>2</sub> within the EOR complex;
- b) CO<sub>2</sub> leakage from the EOR complex through leakage pathways; and
- c) on-site CO<sub>2</sub>-EOR project loss of CO<sub>2</sub> from wells, equipment or other facilities.

##### 1.3.2 Exclusions

This document does not include the following:

- a) lifecycle emissions, including but not limited to CO<sub>2</sub> emissions from capture or transportation of CO<sub>2</sub>, on-site emissions from combustion or power generation, and CO<sub>2</sub> emissions resulting from the combustion of produced hydrocarbons;
- b) storage of CO<sub>2</sub> above ground;
- c) buffer and seasonal storage of CO<sub>2</sub> below ground (similar to natural gas storage);
- d) any technique or product that does not involve injection of CO<sub>2</sub> into the subsurface; and
- e) emissions of any GHGs other than CO<sub>2</sub>.

NOTE Some authorities might require other GHG components of the CO<sub>2</sub> stream to be quantified.
