## Other Titles of Interest

*Design of Close-Fit Liners for the Rehabilitation of Gravity Pipes*, edited by Norman E. “Ed” Kampbell and Jadranka Simicevic. (ASCE/UESI 2021). MOP 145 provides a comprehensive explanation of the design of flexible, close-fit linings for the renewal or rehabilitation of pipes designed for gravity flow such as sanitary sewers, culverts, and storm sewers. (ISBN 978-0-7844-1580-1)

*Design of Water Resource Recovery Facilities*, by the Water Environment Federation (WEF) and ASCE. (ASCE/WEF 2017). This globally renowned publication is the principal reference for contemporary plant design practices of wastewater engineering professionals, augmented with performance information from operating facilities. (ISBN 978-1-260-03118-8)

*Gravity Sanitary Sewer Design and Construction, Second Edition*, edited by Paul Bizier. (ASCE/EWRI/WEF 2007). ASCE MOP 60 and WEF MOP FD-5 provides theoretical and practical guidelines for the design and construction of gravity sanitary sewers. (ISBN 978-0-7844-0900-8)

*Renewal of Potable Water Pipes*, by the Pipeline Infrastructure Committee; edited by Mohammad Najafi and Mario Pore. (ASCE/Pipelines Division 2016). MOP 132 provides a detailed resource on planning, design, and construction using trenchless rehabilitation technologies for pipelines carrying drinking water. (ISBN 978-0-7844-1374-6)

*Water Pipeline Condition Assessment*, by the Task Committee on Water Pipeline Condition Assessment; edited by George F. Ruchti, Jr. (ASCE/UESI 2017). MOP 134 provides water utilities with an appropriate path for adequately determining the structural status of an individual transmission pipeline or pipeline system. (ISBN 978-0-7844-1475-0)

# MANUALS AND REPORTS ON ENGINEERING PRACTICE

(As developed by the ASCE Technical Procedures Committee, July 1930, and revised March 1935, February 1962, and April 1982)

A manual or report in this series consists of an orderly presentation of facts on a particular subject, supplemented by an analysis of limitations and applications of these facts. It contains information useful to the average engineer in his or her everyday work, rather than findings that may be useful only occasionally or rarely. It is not in any sense a "standard," however, nor is it so elementary or so conclusive as to provide a "rule of thumb" for nonengineers.

Furthermore, material in this series, in distinction from a paper (which expresses only one person's observations or opinions), is the work of a committee or group selected to assemble and express information on a specific topic. As often as practicable, the committee is under the direction of one or more of the Technical Divisions and Councils, and the product evolved has been subjected to review by the Executive Committee of the Division or Council. As a step in the process of this review, proposed manuscripts are often brought before the members of the Technical Divisions and Councils for comment, which may serve as the basis for improvement. When published, each manual shows the names of the committees by which it was compiled and indicates clearly the several processes through which it has passed in review, so that its merit may be definitely understood.

In February 1962 (and revised in April 1982), the Board of Direction voted to establish a series titled "Manuals and Reports on Engineering Practice" to include the manuals published and authorized to date, future Manuals of Professional Practice, and Reports on Engineering Practice. All such manual or report material of the Society would have been refereed in a manner approved by the Board Committee on Publications and would be bound, with applicable discussion, in books similar to past manuals. Numbering would be consecutive and would be a continuation of present manual numbers. In some cases of joint committee reports, bypassing of journal publications may be authorized.

*A list of available Manuals of Practice can be found at <http://www.asce.org/bookstore>.*

## FOREWORD

It is with sincere gratitude and great honor that I acknowledge the many years of commitment and hard work offered freely from industry professionals to produce this, the third edition of *Manhole Inspection and Rehabilitation*, ASCE Manuals and Reports on Engineering Practice No. 92 (MOP 92).

To appreciate the many enhancements made to this edition, it is important to understand the history of MOP 92 and to acknowledge the power derived when organizations such as ASCE (and now UESI) and NASSCO join forces to provide technical resources that benefit the entire underground infrastructure industry.

The idea for MOP 92 began in 1991 during an ASCE Pipeline Infrastructure (PINS) meeting during the Water Environment Federation Conference (WEFTEC) in Washington, DC. Chaired by Jay Schrock, MOP 92 was first published in 1997 in partnership with the ASCE Committee on Manhole Rehabilitation of the Pipeline Division of ASCE and NASSCO's Manhole Rehabilitation Committee.

The second edition of MOP 92, published in 2009, included expanded content on safety, manhole inspection, manhole rehabilitation methods, cost-effectiveness analysis, rehabilitation method selection, and construction inspection and quality control.

On the following pages in this, the third edition, the reader will find a new chapter on design, authored by Ed Kampbell, P.E. The reader will also find expanded information on the importance of manhole condition assessment standardization through NASSCO's Manhole Assessment Certification Program (MACP) and proper inspection through NASSCO's Inspector Training Certification Program (ITCP) for Manhole Rehabilitation. Recognizing the critical impact manholes make on the entire collection system, the third edition of MOP 92, also includes an expanded section on various rehabilitation methods and technologies and a summary chapter,

authored by Mr. Bill Shook, on the importance of proper manhole inspection and rehabilitation.

Many dedicated professionals with a passion for manhole rehabilitation technology have been involved with MOP 92 since the very beginning and we appreciate the hard work and contributions made by all. I am especially grateful to Joanne Carroll for her careful editing of this third edition, to Karol Giokas, P.E., for the development of the glossary, and to NASSCO's Technical Advisory Council, especially Lynn Osborn, P.E., Chris Garrett, P.E., and Jerry Weimer, for their many contributions. Finally, I would like to extend special thanks to Blue Ribbon Review Panel members Chris Macey, P.Eng., Rod Thornhill, P.E., and Mark Wade, P.E. for their meticulous review and thoughtful edits to ensure that MOP 92 serves as a trusted industry resource for many years to come.

Because of the collective hard work of NASSCO's Manhole Rehabilitation Committee and these individuals, it is my sincere belief that MOP 92 will continue to be a valued resource to assist agencies in the proper identification of inventory and asset management, the assessment and condition of manhole structures, and decision-making regarding rehabilitation materials and methods, and will provide key quality control measures when specifying the use of rehabilitation materials and technologies.

NASSCO values its partnership with ASCE/UESI and looks forward to continued efforts to set standards for the assessment, maintenance, and rehabilitation of underground infrastructure.

Sheila Joy

NASSCO Executive Director

# CHAPTER 1

## INTRODUCTION

A manhole, alternatively referred to as a maintenance hole, access point, utility hole, inspection chamber, or access chamber, is an access point whose functions include facilitating inspections and maintenance, sewage ventilation, and the joining or changing of direction of the connected pipeline system (NASSCO 2013). The ASCE Infrastructure Report Card (ASCE 2021) gave the United States a wastewater infrastructure system grade of D+, indicative of the state of deterioration, accentuating the urgent need for rehabilitation or replacement. Evaluating and estimating the life of more than 25 million manholes providing access to more than 800,000 miles of public sewers is of considerable importance in the financial planning of agencies. The development of materials and technology over the last 30 years has greatly reduced the need to replace manholes; however, estimating the age when a manhole becomes more cost-effective to replace than to rehabilitate is a function that must be considered on a local basis. The primary objective of this manual is the provision of an inspection and condition grading protocol that serves as the basis for logical selection and application of rehabilitation solutions described in this manual to further the service life of these critical structures.

Through an effective manhole inspection program, agencies can accurately identify inventory and evaluate the condition of these structures. Over time, as comprehensive inspection and assessment information is tracked, it can also aid in determining the optimal and practical times for rehabilitation or even replacement. Gathering of data utilizing standardized techniques and coding enables identification of appropriate methods to remove infiltration and inflow (I&I), reduce corrosion, improve structural integrity, address public safety-related issues, and implement general system maintenance and proactive measures to mitigate future problems.
