English Version

**Postal Services - Hybrid Mail - Functional Specification for postal
 registered electronic mail**

Services postaux - Courrier hybride - Spécifications
 fonctionnelles pour le courrier recommandé électronique

Postalische Dienstleistungen - Hybride Sendungen -
 Funktionale Spezifikation für elektronische
 Posteinschreibsendungen

This Technical Specification (CEN/TS) was approved by CEN on 7 February 2012 for provisional application.

The period of validity of this CEN/TS is limited initially to three years. After two years the members of CEN will be requested to submit their comments, particularly on the question whether the CEN/TS can be converted into a European Standard.

CEN members are required to announce the existence of this CEN/TS in the same way as for an EN and to make the CEN/TS available promptly at national level in an appropriate form. It is permissible to keep conflicting national standards in force (in parallel to the CEN/TS) until the final decision about the possible conversion of the CEN/TS into an EN is reached.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and United Kingdom.

Foreword

This document (CEN/TS 16326:2013) has been prepared by Technical Committee CEN/TC 331 "Postal services", the secretariat of which is held by NEN.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN [and/or CENELEC] shall not be held responsible for identifying any or all such patent rights.

Keeping pace with the changing communications market, postal operators are increasingly using new communication and information technologies to move beyond what is traditionally regarded as their core postal business. They are meeting higher customer expectations with an expanded range of products and value-added services.

Standards are important prerequisites for effective postal operations and for interconnecting the global network. The European Committee for Standardization, their Technical Committee 331 "Postal Services" develops and maintains a growing number of standards to improve the exchange of postal-related information between postal operators, postal handling organisations, customers, suppliers and other partners, including various international organisations.

This functional specification has been developed in close relationship with the following technical standards:

- CEN/TS 15121-1:2011;
- ETSI TS 102 640-1.

The use of this Technical Specification as a basis for any implementation is at the risk of the user. Any party intending such use is strongly advised to seek close contact with the appropriate working group, so that it can be kept informed of ongoing work.

The CEN/TS 16326 was originally published as a JTC 1 standard S52-1 and was adopted by CEN under the current Memorandum of Understanding between JTC 1 and CEN.

According to the CEN/CENELEC Internal Regulations, the national standards organisations of the following countries are bound to announce this Technical Specification: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

Introduction

This document describes the functional specification for a postal operator to build or implement the postal registered electronic mail (abbreviated hereinafter to PReM) system which can be offered to the customers of the postal operator as part of the Secure electronic Postal Services (SePS).

PReM is an electronic version of the traditional postal registered mail service. It uses state-of-the-art cryptographic technologies to provide strong role authentication, protection of message confidentiality and integrity and to add non-repudiation attributes to evidence of events and operations. Therefore, the goal of a PReM is to enhance the traditional e-mail service so as to provide an end-to-end trusted electronic communication service, encompassing both evidence of submission and delivery between authenticated parties.

The service is embodied in the secured and trusted exchange of electronic mail, as every step of the process is logged for future evidence tracing and any entity involved is authenticated. The PReM service comprises the following features:

- secured message forwarding and delivery: ensures the PReM message confidentiality (encryption) and integrity (no modification); and authenticity and non-repudiation of users (mailer and addressee) and postal operators (origin and destination). In addition, PReM messages will be securely transported from mailer to addressee/mailee;
- evidence generation: all significant events within a complete operation cycle are traceable. Types of evidence and evidence formats are described in 7.1.1.1;
- event notification: notification that a particular event/operation has occurred will be generated and sent to corresponding parties;
- archival of evidence: storage of generated evidence for future attestation.

The implementation of part or all of this functional specification might involve the use of intellectual property which is the subject of patent and/or trademark rights. Since the specification was developed in close relationship with ETSI TS 102 640, these might include rights held by ETSI. It is the responsibility of users of the standard to conduct any necessary searches and to ensure that any pertinent rights are in the public domain, are licensed, or are avoided. CEN/TC 331 cannot accept any responsibility in case of infringement, on the part of users of this document, of any third party intellectual property rights. Nevertheless, document users and owners of such rights are encouraged to advise the Secretariat of the UPU Standards Board or the Secretariat of CEN/TC 331 or CEN/TC 331 WG2 of any explicit claim that any technique or solution described herein is protected by such right in any UPU member country. Any such claims will, without prejudice, be documented in the next update of this standard or otherwise at the discretion of the Standards Board or Secretariat of the CEN/TC 331 WG2.

Annex C of this document lists the intellectual property rights brought to the attention of the UPU Standards Board or CEN/TC 331 WG2 prior to approval of the publication of this version of the standard.

1 Scope

This Technical Specification constitutes the functional specification of a secure electronic postal service, referred to as the postal registered electronic mail or PReM service. PReM provides a trusted and certified electronic mail exchange between mailer, postal operators and addressee/mailee. In addition, evidence of corresponding events and operations within the scope of PReM will be generated and archived for future attestation.

The PReM service is defined by reference to the concepts, schemas and operations defined in CEN/TS 15121-1:2011. It utilises six SePS operational verbs (CheckIntegrity, LogEvent, Postmark RetrieveResults, Sign and Verify) and the five additional server-side operational verbs (SendMessageToDestination, Subscribe Notification, UnsubscribeNotification, RejectMessage and ReceiveNotification) to fulfil the operational requirements of a PReM System.

Return of Investment (ROI), market potential, revenues model, business plan and pricing policy are outside the scope of this functional specification. Postal operators are advised to make the necessary marketing study and research prior to considering leasing, procuring or developing such a PReM system in accordance with this functional specification.
