

BSI Standards Publication

Communication networks and systems for power utility automation

Part 90-13: Deterministic networking technologies

National foreword

This Published Document is the UK implementation of IEC TR 61850-90-13:2021.

The UK participation in its preparation was entrusted to Technical Committee PEL/57, Power systems management and associated information exchange.

A list of organizations represented on this committee can be obtained on request to its committee manager.

This publication does not purport to include all the necessary provisions of a contract. Users are responsible for its correct application.

CONTENTS

FOREWORD.....	5
INTRODUCTION.....	7
1 Scope.....	8
2 Normative references	8
3 Terms and definitions, abbreviated terms and acronyms.....	9
3.1 Terms and definitions.....	9
3.2 Abbreviated terms and acronyms	11
4 Characteristics of determinism.....	13
4.1 Deterministic latency.....	13
4.2 Deterministic jitter.....	14
5 Problem Statement.....	15
5.1 Overview.....	15
5.2 Problems with existing technologies.....	16
5.3 Improvements in networking communication from using the capabilities of deterministic communication technologies	17
5.4 Drawbacks of deterministic networking	17
5.4.1 General	17
5.4.2 Change in network design	18
5.4.3 Changes to the network infrastructure	18
5.4.4 Change to the network tools	18
5.4.5 Hardware changes to the IEDs	18
5.4.6 Change to the IED applications.....	18
5.4.7 Change to the standard	18
5.4.8 Backward compatibility and transition phase.....	19
5.5 Survey about problem statement.....	19
6 Deterministic networking – support and improvements for existing use cases.....	19
6.1 Use cases for the LAN.....	19
6.1.1 Requirements	19
6.1.2 Substation automation	20
6.1.3 WAN-based use cases.....	23
6.1.4 Protection and control for Distributed Energy Resources (DER).....	26
6.1.5 Use cases in which determinism supports non-functional requirements	28
6.2 New use cases (in substation automation and over the WAN).....	29
6.2.1 Large control loops	29
6.2.2 Multi-service networks	30
7 Deterministic networking.....	31
7.1 Capabilities and improvements	31
7.1.1 General	31
7.1.2 Time synchronization.....	31
7.1.3 Quality of service (QoS).....	31
7.1.4 Network configuration and management	32
7.2 Deterministic networking technologies	32
7.2.1 Deterministic HSR	32
7.2.2 IEEE 802.1 Time-sensitive networking (TSN).....	34
7.2.3 IETF DetNet	41
7.2.4 Other technologies	42

8	Co-existence and interoperability with existing and emerging technologies (and how to address technology changes)	47
8.1	Relation of TSN to technologies such as SDN (Software Defined Networking) and NFV (Network Function Virtualization)	47
8.2	Relation and interoperability to existing architectures for high-availability and redundancy based on PRP/HSR	48
8.3	Relation and interoperability to existing WAN-architectures based on MPLS (IP/MPLS, MPLS-TP)	48
8.4	Brownfield deployment options	48
8.5	Migration path	49
9	Design consideration for a future utility profile using deterministic networking technologies	50
9.1	IEC 61850 traffic patterns and protocols	50
9.2	Non-IEC 61850 traffic patterns and protocols	52
9.3	High-availability and reliability	53
9.4	Deterministic traffic classification	53
9.5	Conceptual model	53
9.5.1	General	53
9.5.2	Utility profile considerations using 802.1 TSN technologies	54
9.5.3	Specific IEEE 802.1Q-2018 clauses and related amendments	54
9.5.4	Time synchronization	54
10	Harmonization of deterministic networking requirements	54
10.1	IEC 61850-5	54
10.2	IEC 61850-9-2	54
10.3	IEC/IEEE 61850-9-3	54
10.4	IEC TR 61850-90-1	55
10.5	IEC/TR 61850-90-2	55
10.6	IEC TR 61850-90-4	55
10.7	IEC TR 61850-90-12	55
11	Impact on application operation	55
11.1	Scope and dependencies	55
11.2	Impact on existing applications	56
11.3	Impact for new applications and application evolution	56
Annex A	(informative) Related work and liaisons	57

INTERNATIONAL ELECTROTECHNICAL COMMISSION

**COMMUNICATION NETWORKS AND
SYSTEMS FOR POWER UTILITY AUTOMATION –**

Part 90-13: Deterministic networking technologies

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

The main task of IEC technical committees is to prepare International Standards. However, a technical committee may propose the publication of a Technical Report when it has collected data of a different kind from that which is normally published as an International Standard, for example "state of the art".

IEC TR 61850-90-13, which is a technical report, has been prepared by IEC technical committee 57: Power systems management and associated information exchange.

The text of this Technical Report is based on the following documents:

Draft TR	Report on voting
57/2236/DTR	57/2301/RVDTR

Full information on the voting for the approval of this Technical Report can be found in the report on voting indicated in the above table.

This document has been drafted in accordance with the ISO/IEC Directives, Part 2.

A list of all parts in the IEC 61850 series, published under the general title *Communication networks and systems for power utility automation*, can be found on the IEC website.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under "<http://webstore.iec.ch>" in the data related to the specific document. At this date, the document will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

IMPORTANT – The 'colour inside' logo on the cover page of this publication indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.

INTRODUCTION

Deterministic networking technologies enable applications that require bounded communication delays regardless of network load or reconfiguration. They allow traffic of different time-criticality to share the same physical medium. Deterministic network technologies are based on the pre-allocation of resources using for example scheduling, traffic shaping and the pre-emption of low priority messages to guarantee the timely delivery of high-priority traffic.

Power automation and control is an industry domain where deterministic networking is needed to support existing use cases and applications (requiring real-time communication), and to enable new developments. This networking is currently being provided by SDH networks or dedicated (for protection communications) Ethernet networks; however significant drivers (economic and political) are now emerging to use "converged" Ethernet networks.

In this document the term WAN is used for the inter-substation communication networks, with the driving force usually being the desire of a utility to use the same network infrastructure for IT as well as for operational tasks such as inter-substation protection communications.

The term LAN is used for the intra-substation communication networks. Converged networks are those supporting mixed traffic (e.g. process data, configuration management, voice and video surveillance data) in the same network being used for critical power automation applications. In the same way that using public transportation to get from A to B in a timely (deterministic) manner requires the ability to be guaranteed to sit at a particular time, using a communication network for the deterministic delivery of data also requires the guarantee of access at a particular time. This document identifies, describes, and discusses the known technologies to address this determinism issue.

Summary:

Clause 5 describes the problem (with non-deterministic networks);

Clause 6 provides use cases;

Clause 7 lists deterministic networking technologies;

Clause 8 discusses interoperability issues;

Clause 9 suggests changes to the IEC 61850 standards needed to support determinism;

Annex A lists some related work and liaisons.

COMMUNICATION NETWORKS AND SYSTEMS FOR POWER UTILITY AUTOMATION –

Part 90-13: Deterministic Networking Technologies

1 Scope

This part of IEC 61850, which is a Technical Report, provides information, use cases, and guidance on whether and how to use deterministic networking technologies. Furthermore, this document comprises technology descriptions, provides guidance how to achieve compatibility and interoperability with existing technologies, and lays out migration paths. It will separate the problem statement from the possible solutions.
