

BSI Standards Publication

Industrial-process measurement, control and automation — Smart manufacturing

Part 3: Challenges for Cybersecurity

National foreword

This Published Document is the UK implementation of IEC TR 63283-3:2022.

The UK participation in its preparation was entrusted to Technical Committee GEL/65, Measurement and control.

A list of organizations represented on this committee can be obtained on request to its committee manager.

Contractual and legal considerations

This publication has been prepared in good faith, however no representation, warranty, assurance or undertaking (express or implied) is or will be made, and no responsibility or liability is or will be accepted by BSI in relation to the adequacy, accuracy, completeness or reasonableness of this publication. All and any such responsibility and liability is expressly disclaimed to the full extent permitted by the law.

This publication is provided as is, and is to be used at the recipient's own risk.

The recipient is advised to consider seeking professional guidance with respect to its use of this publication.

This publication is not intended to constitute a contract. Users are responsible for its correct application.

This publication is not to be regarded as a British Standard.

INTERNATIONAL ELECTROTECHNICAL COMMISSION

**INDUSTRIAL-PROCESS MEASUREMENT, CONTROL
AND AUTOMATION – SMART MANUFACTURING –**
Part 3: Challenges for cybersecurity

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publications"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as far as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

IEC TR 63283-3 has been prepared by Technical Committee 65: Industrial-process measurement, control and automation. It is a Technical Report.

The text of this Technical Report is based on the following documents:

Draft	Report on voting
65/865/DTR	65/906/RVDTR

Full information on the voting for its approval can be found in the report on voting indicated in the above table.

The language used for the development of this Technical Report is English.

This document was drafted in accordance with ISO/IEC Directives, Part 2, and developed in accordance with ISO/IEC Directives, Part 1 and ISO/IEC Directives, IEC Supplement, available at www.iec.ch/members_experts/refdocs. The main document types developed by IEC are described in greater detail at www.iec.ch/standardsdev/publications.

A list of all parts in the IEC 63283 series, published under the general title *Industrial-process measurement, control and automation – Smart Manufacturing*, can be found on the IEC website.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under webstore.iec.ch in the data related to the specific document. At this date, the document will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

IMPORTANT – The 'colour inside' logo on the cover page of this publication indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.

INTRODUCTION

Smart Manufacturing comes with many new challenges to cybersecurity. It starts from architectural paradigm shifts combining many valuable assets (design, production planning, engineering, supply chain management, etc.) currently enclosed into dedicated systems into one system. Many stakeholders need to cooperate and exchange information. This is enabled by the application of new information technologies such as industrial internet-of-things (IIoT), edge technology, machine learning, wireless communications and new production technologies as additive manufacturing, exposure of data belonging to contracting parties.

From the point of view of cybersecurity increasing digitalization, tight networking and interconnectivity, usage of standard IT technologies, etc., increase the attack surface and could enable new types of attack. This puts the protection goals integrity and availability of the production system, as well as confidentiality of data involved in the production process at risk. Examples are counterfeiting, loss of know-how or intellectual property, leaking of key performance indicators.

This Technical Report contains smart manufacturing challenges for cybersecurity, i.e., it identifies issues that need to be addressed/fulfilled by smart manufacturing systems in order to ensure their security.

Cybersecurity is a concern for any kind of production method such as:

- discrete manufacturing;
- continuous production;
- batch production.

The tasks of the IEC 65 WG 23 taskforce cybersecurity are:

- review smart manufacturing use cases to find cybersecurity relevant scenarios and requirements;
- if necessary, propose additional smart manufacturing use cases showing potential cybersecurity issues;
- develop a list of smart manufacturing requirements that are necessary to provide cybersecurity in smart manufacturing components, systems, design, integration, and operation and maintenance;
- propose possibilities for smart manufacturing specific profiling in order to simplify application of IEC 62443 (all parts).

This report is limited to cybersecurity related impacts of smart manufacturing. Other requirements for smart manufacturing systems such as safety and reliability are left to be addressed in future reports. However, cybersecurity needs to consider and address safety issues triggered by security attacks.

The initial use case analysis constitutes a bottom-up approach intended to gain a better understanding of the topic. The provided use cases are not necessarily exhaustive. A top-down approach for a generic smart manufacturing model is aimed for in the future.

INDUSTRIAL-PROCESS MEASUREMENT, CONTROL AND AUTOMATION – SMART MANUFACTURING –

Part 3: Challenges for cybersecurity

1 Scope

This part of IEC 63283 identifies challenges which apply to the engineering of a smart manufacturing facility related to cybersecurity.

NOTE Cybersecurity challenges and how to deal with them can impose constraints on the engineering of the smart manufacturing system.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

IEC 62443 (all parts), *Security for industrial automation and control systems*

3 Terms, definitions, abbreviated terms and acronyms

3.1 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <http://www.electropedia.org/>
- ISO Online browsing platform: available at <http://www.iso.org/obp>

NOTE The definitions are fully aligned with IEC TR 63283-1¹ (65/683/DTR).

3.1.1 access

ability and means to communicate with or otherwise interact with a system in order to use system resources

Note 1 to entry: Access may involve physical access (authorization to be allowed physically in an area, possession of a physical key lock, PIN code, or access card or biometric attributes that allow access) or logical access (authorization to log in to a system and application, through a combination of logical and physical means).
