PLEASE NOTE:

The information contained in this document was obtained from sources believed to be reliable and is based on technical information and experience currently available from members of the Compressed Gas Association, Inc. and others. However, the Association or its members, jointly or severally, make no guarantee of the results and assume no liability or responsibility in connection with the information or suggestions herein contained. Moreover, it should not be assumed that every acceptable commodity grade, test or safety procedure or method, precaution, equipment or device is contained within, or that abnormal or unusual circumstances may not warrant or suggest further requirements or additional procedure.

This document is subject to periodic review, and users are cautioned to obtain the latest edition. The Association invites comments and suggestions for consideration. In connection with such review, any such comments or suggestions will be fully reviewed by the Association after giving the party, upon request, a reasonable opportunity to be heard. Proposed changes may be submitted via the Internet at our web site, www.cganet.com.

This document should not be confused with federal, state, provincial, or municipal specifications or regulations; insurance requirements; or national safety codes. While the Association recommends reference to or use of this document by government agencies and others, this document is purely voluntary and not binding unless adopted by reference in regulations.

A listing of all publications, audiovisual programs, safety and technical bulletins, and safety posters is available via the Internet at our website at www.cganet.com. For more information contact CGA. Phone: 703-788-2700, ext. 799. E-mail: customerservice@cganet.com.

6.1 Fundamentals of deflagration	3
6.2 Deflagration requirements	3
7 Recommendations	4
7.1 General.....	4
7.2 Carbon dioxide source risk analysis	4
7.3 Carbon dioxide supplier communication	5
7.4 Carbon dioxide feed gas supplier equipment leaks.....	5
7.5 Purging and isolation during carbon dioxide feed gas supplier maintenance	5
7.6 Adsorber bed issues.....	6
7.7 Adsorber bed temperature monitoring.....	6
7.8 Handling of spent media.....	6
7.9 Catalytic oxidation issues	6
7.10 Oxygen safety training for personnel of carbon dioxide plants with catalytic oxidation systems.....	7
7.11 Feed gas analyzers	7
7.12 Vacuum breakers monitoring.....	7
8 References	7

1 Introduction

Most merchant liquid carbon dioxide sold in North America is a by-product recovered from sources such as ammonia fertilizer plants, ethanol fermentation, petroleum refinery hydrogen reformers, a variety of petrochemical processes, and natural wells. The by-product gas typically is transported by pipeline from the source to adjacent carbon dioxide purification and liquefaction plants.

Typical by-product carbon dioxide contains 95% to 99.9% carbon dioxide on a dry basis, although some lower purity sources also are used. Depending on the source, the by-product gas also contains a variety of impurities. During process upsets at the source plants, the quantity of impurities can increase significantly and relative concentrations can vary. A number of energy releases at by-product carbon dioxide plants have been attributed to the presence of high levels of hydrogen, hydrocarbons, oxygen, or a combination of these contaminants in the carbon dioxide plant feed gas.

2 Scope

This publication alerts carbon dioxide producers and plant operators to potential risks related to changing carbon dioxide feed gas composition. It also discusses the dangers related to excess oxygen and hydrocarbon levels in catalytic oxidation and sulfur and hydrocarbon removal systems used to purify carbon dioxide. In addition, potential fire hazards that can be encountered when spent adsorbent media is exposed to air during periodic replacement are reviewed. Finally, this publication provides recommendations to prevent fire and explosions related to these causes in by-product carbon dioxide plants.

This publication does not cover the physical and chemical properties, the manufacturing process, or physiological effects of carbon dioxide. For more information on these topics see CGA G-6, *Carbon Dioxide* [1].¹

3 Definitions

For the purpose of this publication, the following definitions apply.

3.1 Publication terminology

3.1.1 Shall

Indicates that the procedure is mandatory. It is used wherever the criterion for conformance to specific recommendations allows no deviation.

3.1.2 Should

Indicates that a procedure is recommended.

3.1.3 May

Indicates that the procedure is optional.

3.1.4 Will

Is used only to indicate the future, not a degree of requirement.

3.1.5 Can

Indicates a possibility or ability.

3.2 Technical definitions

3.2.1 Carbon dioxide

Chemical compound consisting of one atom of carbon bonded to two atoms of oxygen, expressed by the chemical formula CO₂.

NOTE—The shipping name for carbon dioxide in uninsulated cylinders in the United States and Canada is “Carbon Dioxide.”
