Currently in preview, click buy full version

**Abstract:** The methods for assessing and predicting the reliability of software, based on a life-cycle approach to software reliability engineering (SRE), are prescribed in this recommended practice. It provides information necessary for the application of software reliability (SR) measurement to a project, lays a foundation for building consistent methods, and establishes the basic principle for collecting the data needed to assess and predict the reliability of software. The recommended practice prescribes how any user can participate in SR assessments and predictions.

**Keywords:** IEEE 1633™, software failure modes, software reliability

## Important Notices and Disclaimers Concerning IEEE Standards Documents

IEEE documents are made available for use subject to important notices and legal disclaimers. These notices and disclaimers, or a reference to this page, appear in all standards and may be found under the heading “Important Notices and Disclaimers Concerning IEEE Standards Documents.” They can also be obtained on request from IEEE or viewed at <http://standards.ieee.org/IPR/disclaimers.html>.

## Notice and Disclaimer of Liability Concerning the Use of IEEE Standards Documents

IEEE Standards documents (standards, recommended practices, and guides), both full-use and trial-use, are developed within IEEE Societies and the Standards Coordinating Committees of the IEEE Standards Association (“IEEE-SA”) Standards Board. IEEE (“the Institute”) develops its standards through a consensus development process, approved by the American National Standards Institute (“ANSI”), which brings together volunteers representing varied viewpoints and interests to achieve the final product. IEEE Standards are documents developed through scientific, academic, and industry-based technical working groups. Volunteers in IEEE working groups are not necessarily members of the Institute and participate without compensation from IEEE. While IEEE administers the process and establishes rules to promote fairness in the consensus development process, IEEE does not independently evaluate, test, or verify the accuracy of any of the information or the soundness of any judgments contained in its standards.

IEEE Standards do not guarantee or ensure safety, security, health, or environmental protection, or ensure against interference with or from other devices or networks. Implementers and users of IEEE Standards documents are responsible for determining and complying with all appropriate safety, security, environmental, health, and interference protection practices and all applicable laws and regulations.

IEEE does not warrant or represent the accuracy or content of the material contained in its standards, and expressly disclaims all warranties (express, implied and statutory) not included in this or any other document relating to the standard, including, but not limited to, the warranties of: merchantability; fitness for a particular purpose; non-infringement; and quality, accuracy, effectiveness, currency, or completeness of material. In addition, IEEE disclaims any and all conditions relating to: results; and workmanlike effort. IEEE standards documents are supplied “AS IS” and “WITH ALL FAULTS.”

Use of an IEEE standard is wholly voluntary. The existence of an IEEE standard does not imply that there are no other ways to produce, test, measure, purchase, market, or provide other goods and services related to the scope of the IEEE standard. Furthermore, the viewpoint expressed at the time a standard is approved and issued is subject to change brought about through developments in the state of the art and comments received from users of the standard.

In publishing and making its standards available, IEEE is not suggesting or rendering professional or other services for, or on behalf of, any person or entity nor is IEEE undertaking to perform any duty owed by any other person or entity to another. Any person utilizing any IEEE Standards document, should rely upon his or her own independent judgment in the exercise of reasonable care in any given circumstances or, as appropriate, seek the advice of a competent professional in determining the appropriateness of a given IEEE standard.

IN NO EVENT SHALL IEEE BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO: PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE PUBLICATION, USE OF, OR RELIANCE UPON ANY STANDARD, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE AND REGARDLESS OF WHETHER SUCH DAMAGE WAS FORESEEABLE.

## Translations

The IEEE consensus development process involves the review of documents in English only. In the event that an IEEE standard is translated, only the English version published by IEEE should be considered the approved IEEE standard.

## Official statements

A statement, written or oral, that is not processed in accordance with the IEEE-SA Standards Board Operations Manual shall not be considered or inferred to be the official position of IEEE or any of its committees and shall not be considered to be, or be relied upon as, a formal position of IEEE. At lectures, symposia, seminars, or educational courses, an individual presenting information on IEEE standards shall make it clear that his or her views should be considered the personal views of that individual rather than the formal position of IEEE.

## Comments on standards

Comments for revision of IEEE Standards documents are welcome from any interested party, regardless of membership affiliation with IEEE. However, IEEE does not provide consulting information or advice pertaining to IEEE Standards documents. Suggestions for changes in documents should be in the form of a proposed change of text, together with appropriate supporting comments. Since IEEE standards represent a consensus of concerned interests, it is important that any responses to comments and questions also receive the concurrence of a balance of interests. For this reason, IEEE and its members of its societies and Standards Coordinating Committees are not able to provide an instant response to comments or questions except in those cases where the matter has previously been addressed. For the same reason, IEEE does not respond to interpretation requests. Any person who would like to participate in revisions to an IEEE standard is welcome to join the relevant IEEE working group.

Comments on standards should be submitted to the following address:

Secretary, IEEE-SA Standards Board  
445 Hoes Lane  
Piscataway, NJ 08854 USA

## Laws and regulations

Users of IEEE Standards documents should consult all applicable laws and regulations. Compliance with the provisions of any IEEE Standards document does not imply compliance to any applicable regulatory requirements. Implementers of the standard are responsible for observing or referring to the applicable regulatory requirements. IEEE does not, by the publication of its standards, intend to urge action that is not in compliance with applicable laws, and these documents may not be construed as doing so.

## Copyrights

IEEE draft and approved standards are copyrighted by IEEE under U.S. and international copyright laws. They are made available by IEEE and are adopted for a wide variety of both public and private uses. These include, but not limited to, use, by reference, in laws and regulations, and use in private self-regulation, standardization, and the promotion of engineering practices and methods. By making these documents available for use and adoption by public authorities and private users, IEEE does not waive any rights in copyright to the documents.

## Photocopies

Subject to payment of the appropriate fee, IEEE will grant users a limited, non-exclusive license to photocopy portions of any individual standard for company or organizational internal use or individual, non-commercial use only. To arrange for payment of licensing fees, please contact Copyright Clearance Center, Customer Service, 222 Rosewood Drive, Danvers, MA 01923 USA; +1 978 750 8400. Permission to photocopy portions of any individual standard for educational classroom use can also be obtained through the Copyright Clearance Center.

## Updating of IEEE Standards documents

Users of IEEE Standards documents should be aware that these documents may be superseded at any time by the issuance of new editions or may be amended from time to time through the issuance of amendments, corrigenda, or errata. An official IEEE document at any point in time consists of the current edition of the document together with any amendments, corrigenda, or errata then in effect.

Every IEEE standard is subjected to review at least every ten years. When a document is more than ten years old and has not undergone a revision process, it is reasonable to conclude that its contents, although still of some value, do not wholly reflect the present state of the art. Users are cautioned to check to determine that they have the latest edition of any IEEE standard.

In order to determine whether a given document is the current edition and whether it has been amended through the issuance of amendments, corrigenda, or errata, visit the IEEE Xplore at <http://ieeexplore.ieee.org/> or contact IEEE at the address listed previously. For more information about the IEEE-SA or IEEE's standards development process, visit the IEEE-SA Website at <http://standards.ieee.org>.

## Errata

Errata, if any, for all IEEE standards can be accessed on the IEEE-SA Website at the following URL: <http://standards.ieee.org/findstds/errata/index.html>. Users are encouraged to check this URL for errata periodically.

## Patents

Attention is called to the possibility that implementation of this standard may require use of subject matter covered by patent rights. By publication of this standard, no position is taken by the IEEE with respect to the existence or validity of any patent rights in connection therewith. If a patent holder or patent applicant has filed a statement of assurance via an Accepted Letter of Assurance, then the statement is listed on the IEEE-SA Website at <http://standards.ieee.org/about/sasb/patcom/patents.html>. Letters of Assurance may indicate whether the Submitter is willing or unwilling to grant licenses under patent rights without compensation or under reasonable rates, with reasonable terms and conditions that are demonstrably free of any unfair discrimination to applicants desiring to obtain such licenses.

Essential Patent Claims may exist for which a Letter of Assurance has not been received. The IEEE is not responsible for identifying Essential Patent Claims for which a license may be required, for conducting inquiries into the legal validity or scope of Patents Claims, or determining whether any licensing terms or conditions provided in connection with submission of a Letter of Assurance, if any, or in any licensing agreements are reasonable or non-discriminatory. Users of this standard are expressly advised that determination of the validity of any patent rights, and the risk of infringement of such rights, is entirely their own responsibility. Further information may be obtained from the IEEE Standards Association.

## Participants

At the time this IEEE recommended practice was completed, the IEEE 1633 Working Group had the following membership:

**Ann Marie Neufelder, Chair**  
**Martha Wetherholt, Vice Chair**  
**Debra Haehn, Secretary**  
**Lou Gullo, Sponsor Chair**

Jacob Axman  
Bakul Banerjee  
David Bernreuther  
Nematollah Bidokhti  
Robert Binder  
Sonya Davis  
Mary Ann DeCicco  
Lance Fiondella  
Willie Fitzpatrick  
Kevin Frye  
Loren Garroway  
Richard E. Gibbs III  
Michael Grottke  
Darwin Heiser

Nathan Herbert  
Claire Jones  
Burdette Joyner  
Ahlia T. Kitwana  
Peter Lakey  
Ming Li  
Andy Long  
Debra Greenhalgh Lubas  
Andrew Mack  
Franklin Marotta  
Kevin Mattos  
Brian McQuillan  
Rajesh Murthy

Allen Nikora  
Mark Ofori-kyei  
Robert Raygan  
Ying Shi  
Marty Shooman  
Mark Sims  
Michael Siok  
Shane Smith  
George Stankovic  
Kishor Srinivasan  
Theodor Wandji  
Martin Wayne  
Yuan Wei  
Harry White

The following members of the individual balloting committee voted on this recommended practice. Balloters may have voted for approval, disapproval, or abstention.

Johann Amsenga  
Bakul Banerjee  
Pieter Botman  
Bill Brown  
Keith Chow  
Paul Croll  
Sonya Davis  
Mary Ann DeCicco  
Neal Dowling  
Richard Doyle  
Lance Fiondella  
Debra Greenhalgh  
Randall Groves  
Louis Gullo

Debra Haehn  
Jon Hagar  
Werner Hoelzl  
Bernard Housh  
Norivuka Mouchi  
Cherry Jones  
Piotr Kozicki  
Cand Kiger  
Ahna Kitwana  
Edward McCall  
Jeffrey Moore  
Rajesh Murthy  
Andrew Nack

Ann Marie Neufelder  
Michael Newman  
Mark Ofori-Kyei  
Howard Penrose  
Julian Profir  
Stephen Schwarm  
Jeremy Smith  
Thomas Starai  
Eugene Stoudenmire  
Walter Struppler  
Eric Thibodeau  
Martha Wetherholt  
Paul Work  
Daidi Zhong

When the IEEE-SA Standards Board approved this recommended practice on 22 September 2016, it had the following membership:

**Jean-Philippe Faure**, *Chair*  
**Ted Burse**, *Vice Chair*  
**John D. Kulick**, *Past Chair*  
**Konstantinos Karachalios**, *Secretary*

Chuck Adams  
Masayuki Ariyoshi  
Stephen Dukes  
Jianbin Fan  
Ronald W. Hotchkiss  
J. Travis Griffith

Gary Hoffman  
Michael Janezic  
Joseph L. Koepfinger\*  
Hung Ling  
Kevin Lu  
Gary Robinson  
Annette D. Reilly

Mehmet Ulema

## Introduction

This introduction is not part of IEEE Std 1633-2016, IEEE Recommended Practice on Software Reliability.

Software is, from a materials viewpoint, both malleable and ductile. This means there are multiple ways to introduce failures, intentional and un-intentional. Fixing a software defect can introduce a potential defect. In many cases the failures that result from software defects are both predictable and avoidable but they still occur because of the following:

- a) Lack of available calendar time/resources to find all of the defects that can result in failures
- b) Exceedingly complex event driven systems that are difficult to conceptualize and therefore implement and test
- c) Organizational culture that neglects to support sufficient rigor, skills, or methods required to find the defects
- d) Technical decisions that result in incorrect architecture or design decision that cannot support the stakeholders specifications
- e) Insufficient project or risk management that leads to schedule delays that lead to less time for reliability testing
- f) Operations—Contract issues, interoperability due to bad specifications and stakeholder communications

Even a small number of software failures can lead to monetary catastrophes such as a cancelled project. Hardware (HW) failures can be random, due to wear-out or the result of a systematic design flaw. Reliability maintainability availability (RMA) is used to prevent and deal with hardware failures. Software failures may result from systematic flaws in the requirements, design, code or interfaces. Hence, software failure does not require an RMA but instead a corrective action to an existing installation. Software failures can be common cause failures in that the same failure mode can cause multiple failures in more than one part of the software.

Software reliability engineering (SRE) is an established discipline that can help organizations improve the reliability of their products and processes. It is important for an organization to have a process discipline if it is to produce high reliability software. There are specific practices and recommendations, each of which has a context within the software engineering life cycle. A specific practice may be implemented or used in a particular stage of the life cycle or spread across several stages. Figure 1 shows how the focus of SRE shifts as a project progresses from inception to release. The size of each bubble on this figure corresponds to how much the particular SRE practices are being executed during each particular phase of development or operation. For example, in software engineering projects, the failure modes and effects analysis (FMEA) is typically performed earlier in the life cycle.

**Figure 1—SRE focus by stage**

The scope of this recommended practice is to address software reliability (SR). It does not specifically address systems reliability, software safety, or software security. However, it does recognize that safety and security requirements are part of the initial risk assessment. The recommended practice only briefly addresses software quality. This recommended practice provides a common baseline for discussion and prescribes methods for assessing and predicting the reliability of software. The recommended practice is intended to be used in support of designing, developing, and testing software and to provide a foundation on which practitioners can build consistent methods for assessing the reliability of software. It is intended to meet the needs of software practitioners and users who are confronted with varying terminology for reliability measurement and a plethora of model and data collection methods. This recommended practice contains information necessary for the application of SR measurement to a project. This includes SR activities throughout the software life cycle (SRLC) starting at requirements generation by identifying the application, specifying and analyzing requirements, and continuing into the implementation.

This standard includes guidance on the following:

- Common terminology
- Assessment of software reliability risks that pertain to the software or project
- Software failure mode analyses that can help to identify and reduce the types of defects most likely to result in a system failure
- Models for predicting software reliability early in development
- Models for estimating software reliability in testing and operation
- Test coverage and test selection
- Data collection procedures to support SR estimation and prediction
- Determining when to release a software system, or to stop testing the software and implement corrections
- Identifying elements in a software system that are leading candidates for redesign to improve reliability

### *Revisions to the document and notes*

- This document is a revision of IEEE Std 1633-2008.
- Addition of models that can be used early in development, before testing, to predict software reliability
- Addition of failure modes analysis
- Revision of the software reliability growth models so as to be more practical
- Addition of practical guidance for selecting the best models
- Addition of techniques for applying SRE in incremental development
- Addition of methods to assess the SRE related risks

### *Structure of the recommended practice*

This recommended practice contains six clauses and seven annexes as follows:

- Clause 1 provides the overview.
- Clause 2 provides the normative references.
- Clause 3 provides the definitions, acronyms, and abbreviations
- Clause 4 provides the roles, approaches, and concepts related to SRE.
- Clause 5 provides the SRE procedures.
- Clause 6 provides the predictive and estimation SRE models.
- Annex A contains software failure modes effects analysis (SFMEA) templates.
- Annex B provides methods for predicting EKSLOC (Effective 1000 Source Lines of Code), which is necessary for the reliability predictions as well as for models that predict software defect density and defects prior to the testing phase.
- Annex C provides additional software reliability growth models and provides the results of a survey of most used software reliability growth models.
- Annex D provides the estimated cost of the SRE tasks.
- Annex E contains a list of tools that pertain to SRE tasks.
- Annex F contains examples.
- Annex G contains an informative Bibliography.

# IEEE Recommended Practice on Software Reliability

## 1. Overview

### 1.1 Scope

This recommended practice defines the software reliability engineering (SRE) processes, prediction models, growth models, tools, and practices of an organization. This document and its models and tools are useful to any development organization to identify the methods, equations, and criteria for quantitatively assessing the reliability of a software or firmware subsystem or product. Organizations that acquire software subsystems or products developed with consideration to this recommended practice will benefit by knowing the reliability of the software prior to acquisition. This document does not seek to certify either the software or firmware or the processes employed for developing the software or firmware.

### 1.2 Purpose

The purpose for assessing the reliability of a software or firmware subsystem or product is to determine whether the software has met an established reliability objective and facilitate improvement of product reliability. The document defines the recommended practices for predicting software reliability (SR) early in development so as to facilitate planning, sensitivity analysis and trade-offs. This document also defines the recommended practices for estimating SR during test and operation so as to establish whether the software or firmware meets an established objective for reliability.

## 2. Normative references

The following referenced documents are indispensable for the application of this document (i.e., they must be understood and used, so each referenced document is cited in text and its relationship to this document is explained). For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments or corrigenda) applies.
