# IEEE Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems

Sponsor

**Industrial and Commercial Power Systems Department  
of the  
IEEE Industry Applications Society**

Approved 14 June 2001

**IEEE-SA Standards Board**

**Abstract:** The principles of system protection and the proper selection, application, and coordination of components that may be required to protect industrial and commercial power systems against abnormalities that could reasonably be expected to occur in the course of system operation are presented in a simple, yet comprehensive, format. The principles presented apply to both new electrical system design and to the changing, upgrading, or expansion of an existing electrical distribution system.

**Keywords:** bus protection, cable protection, calibration, conductor protection, coordinating time intervals, current transformers, current-limiting fuses, fuse coordination, fuse selectivity, generator grounding, generator protection, high-voltage fuses, liquid preservation systems, low-voltage motor protection, medium-voltage motor protection, motor protection, overcurrent protection, potential transformers, power fuses, protective relays, relay application principles, relay operating principles, service protection, short-circuit protection, switchgear protection, system design, system protection, transformer protection, voltage transformers

**IEEE Standards** documents are developed within the IEEE Societies and the Standards Coordinating Committees of the IEEE Standards Association (IEEE-SA) Standards Board. The IEEE develops its standards through a consensus development process, approved by the American National Standards Institute, which brings together volunteers representing varied viewpoints and interests to achieve the final product. Volunteers are not necessarily members of the Institute and serve without compensation. While the IEEE administers the process and establishes rules to promote fairness in the consensus development process, the IEEE does not independently evaluate, test, or verify the accuracy of any of the information contained in its standards.

Use of an IEEE Standard is wholly voluntary. The IEEE disclaims liability for any personal injury, property or other damage, of any nature whatsoever, whether special, indirect, consequential, or compensatory, directly or indirectly resulting from the publication, use of, or reliance upon this, or any other IEEE Standard document.

The IEEE does not warrant or represent the accuracy or content of the material contained herein, and expressly disclaims any express or implied warranty, including any implied warranty of merchantability or fitness for a specific purpose, or that the use of the material contained herein is free from patent infringement. IEEE Standards documents are supplied **“AS IS.”**

The existence of an IEEE Standard does not imply that there are no other ways to produce, test, measure, purchase, market, or provide other goods and services related to the scope of the IEEE Standard. Furthermore, the viewpoint expressed at the time a standard is approved and issued is subject to change brought about through developments in the state of the art and comments received from users of the standard. Every IEEE Standard is subjected to review at least every five years for revision or reaffirmation. When a document is more than five years old and has not been reaffirmed, it is reasonable to conclude that its contents, although still of some value, do not wholly reflect the present state of the art. Users are cautioned to check to determine that they have the latest edition of any IEEE Standard.

In publishing and making this document available, the IEEE is not suggesting or rendering professional or other services for, or on behalf of, any person or entity. Neither is the IEEE undertaking to perform any duty owed by any other person or entity to another. Any person utilizing this, and any other IEEE Standards document, should rely upon the advice of a competent professional in determining the exercise of reasonable care in any given circumstances.

**Interpretations:** Occasionally questions may arise regarding the meaning of portions of standards as they relate to specific applications. When the need for interpretations is brought to the attention of IEEE, the Institute will initiate action to prepare appropriate responses. Since IEEE Standards represent a consensus of concerned interests, it is important to ensure that any interpretation has also received the concurrence of a balance of interests. For this reason, IEEE and the members of its societies and Standards Coordinating Committees are not able to provide an instant response to interpretation requests except in those cases where the matter has previously received formal consideration.

Comments for revision of IEEE Standards are welcome from any interested party, regardless of membership affiliation with IEEE. Suggestions for changes in documents should be in the form of a proposed change of text, together with appropriate supporting comments. Comments on standards and requests for interpretations should be addressed to:

Secretary, IEEE-SA Standards Board

Note: Attention is called to the possibility that implementation of this standard may require use of subject matter covered by patent rights. By publication of this standard, no position is taken with respect to the existence or validity of any patent rights in connection therewith. The IEEE shall not be responsible for identifying patents for which a license may be required by an IEEE standard or for conducting inquiries into the legal validity or scope of those patents that are brought to its attention.

The IEEE and its designees are the sole entities that may authorize the use of the IEEE-owned certification marks and/or trademarks to indicate compliance with the materials set forth herein.

Authorization to photocopy portions of any individual standard for internal or personal use is granted by the Institute of Electrical and Electronics Engineers, Inc., provided that the appropriate fee is paid to Copyright Clearance Center. To arrange for payment of licensing fee, please contact Copyright Clearance Center, Customer Service, 222 Rosewood Drive, Danvers, MA 01923 USA; +1 978 750 8400. Permission to photocopy portions of any individual standard for educational classroom use can also be obtained through the Copyright Clearance Center.

## Introduction

(This introduction is not a part of IEEE Std 242-2001, IEEE Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems.)

IEEE Std 242-2001, the *IEEE Buff Book*<sup>™</sup>, has been extensively revised and updated since it was first published in 1975. The *IEEE Buff Book* deals with the proper selection, application, and coordination of the components that constitute system protection for industrial plants and commercial buildings. System protection and coordination serve to minimize damage to a system and its components in order to limit the extent and duration of any service interruption occurring on any portion of the system.

A valuable, comprehensive sourcebook for use at the system design stage as well as in modifying existing operations, the *IEEE Buff Book* is arranged in a convenient step-by-step format. It presents complete information on protection and coordination principles designed to protect industrial and commercial power systems against any abnormalities that could reasonably be expected to occur in the course of system operation.

Design features are provided for

- Quick isolation of the affected portion of the system while maintaining normal operation elsewhere
- Reduction of the short-circuit current to minimize damage to the system, its components, and the utilization equipment it supplies
- Provision of alternate circuits, automatic throwovers, and automatic reclosing devices

## Participants

At the time this recommended practice was approved, the IEEE Working Group on Protection and Coordination of Industrial and Commercial Power Systems had the following members and contributors:

**Carey Cook, Chair**

- Chapter 1: First principles—**Robert G. Hoerauf, Chair**; R. G. (Jerry) Irvine
- Chapter 2: Short-circuit calculations—**Louie J. Powell, Chair**; David S. Baker, Chet Davis, Jean F. Witte
- Chapter 3: Instrument transformers—**James D. Bailey** and **David S. Baker, Cochairs**; B. J. Behroon, Louie J. Powell, Marcelo Valdes
- Chapter 4: Selection and application of protective relays—**Keith R. Cooper, N. T. (Terry) Stringer, John F. Witte, Cochairs**; Bruce G. Bailey, David S. Baker, James W. Brosnahan, Carey J. Cook, David D. Shipp, John F. Witte
- Chapter 5: Low-voltage fuses—**Vincent J. Saporita, Chair**; Robert L. Smith, Alan F. Wilkinson
- Chapter 6: High-voltage fuses—**John R. Cooper, Chair**; Carey J. Cook, Herb Pflanz, Kris Ranjan, John F. Witte

- Chapter 7: Low-voltage circuit breakers—**George D. Gregory**, *Chair*; Bruce G. Bailey, John Chiloyan, Keith R. Cooper, R. G. (Jerry) Irvine, Steve Schaffer
- Chapter 8: Ground-fault protection—**Shaun P. Slattery**, *Chair*; James P. Brosnahan, John Chiloyan, Edward Gaylon, Daniel J. Love, Elliot Rappaport, Steven Schaffer, S. I. Venugopalan
- Chapter 9: Conductor protection—**William Reardon**, *Chair*; John Chiloyan, George D. Gregory, Alan C. Pierce, Vincent J. Saporita
- Chapter 10: Motor protection—**Daniel J. Love**, *Chair*; Al Hughes, Alan C. Pierce, Lorraine K. Padden, Joseph S. Dudor, R. G. (Jerry) Irvine
- Chapter 11: Transformer protection—**Alan C. Pierce**, *Chair*; Carey J. Cook, John R. Cooper, Jerry Frank, Vincent J. Saporita, N. T. (Terry) Stringer, Ralph H. Young
- Chapter 12: Generator protection—**Alan C. Pierce**, *Chairs*; Jay D. Fisher, Robert G. Hoerauf, Daniel J. Love, Robert L. Simpson, Ralph H. Young
- Chapter 13: Bus and switchgear protection—**Robert L. Smith, Jr.**, *Chair*; Edward Gaylon, Steve Schaffer, John Steele
- Chapter 14: Service supply line protection—**Lorraine K. Padden**, *Chair*; Consumer Interface Protection and Relaying Practices Subcommittee of the IEEE Power Systems Relaying Committee
- Chapter 15: Overcurrent coordination—**N. T. (Terry) Stringer**, *Chair*; Bruce G. Bailey, Keith R. Cooper, Joseph S. Dudor, Douglas Durand, Tim Fink, Jay D. Fisher, George D. Gregory, William M. Hall, Steve Schaffer, John F. Witte, Ralph H. Young
- Chapter 16: Maintenance, testing, and calibration—**R. G. (Jerry) Irvine**, *Chair*; Donald J. Akers, Jerry S. Baskin, Roderic C. Hogeman, Ted Olsen, Gabe Paoletti, Elliot Rappaport, David, L. Swindler, Norman Woodley

The following members of the balloting group voted on this standard. Balloters may have voted for approval, disapproval, or abstention.

Bruce G. Bailey	George D. Gregory	Vincent J. Saporita
James D. Bailey	Robert G. Hoerauf	David D. Shipp
David S. Baker	R. G. (Jerry) Irvine	Shaun P. Slattery
Ray M. Clark	Daniel J. Love	Robert L. Smith, Jr.
Carey J. Cook	Lorraine K. Padden	N. T. (Terry) Stringer
John R. Cooper	Alan C. Pierce	John F. Witte
Chet Davis	Louie J. Powell	Ralph H. Young
	William Reardon	

When the IEEE-SA Standards Board approved this standard on 14 June 2001, it had the following membership:

**Donald N. Heirman, *Chair***  
**James T. Carlo, *Vice Chair***  
**Judith Gorman, *Secretary***

Satish K. Aggarwal  
Mark D. Bowman  
Gary R. Engmann  
Harold E. Epstein  
H. Landis Floyd  
Jay Forster\*  
Howard M. Frazier  
Ruben D. Garzon

James H. Gurney  
Richard J. Holleman  
Lowell G. Johnson  
Robert J. Kennelly  
Joseph L. Koepfinger\*  
Peter H. Lips  
L. Bruce McClung  
Daleep C. Mohla

James W. Moore  
Robert F. Munzner  
Ronald C. Petersen  
Gerald H. Peterson  
John B. Posey  
Gary S. Robinson  
Akio Tojo  
Donald W. Zipse

\*Member Emeritus

Also included is the following nonvoting IEEE-SA Standards Board liaison:

Alan Cookson, *NIST Representative*  
Donald R. Volzka, *TAB Representative*

Noelle D. Humenick  
*IEEE Standards Project Editor*

# IEEE Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems

## Chapter 1 First principles

### 1.1 Overview

#### 1.1.1 Scope

IEEE Std 242-2001, commonly known as the *IEEE Buff Book*<sup>TM</sup>, is published by the Institute of Electrical and Electronics Engineers (IEEE) as a reference source to provide a better understanding of the purpose for and techniques involved in the protection and coordination of industrial and commercial power systems.

IEEE Std 242-2001 has been prepared on a voluntary basis by engineers and designers functioning as a working group within the IEEE, under the Industrial and Commercial Power Systems Department of the Industry Applications Society. This recommended practice is not intended as a replacement for the many excellent texts available in this field. IEEE Std 242-2001 complements the other standards in the *IEEE Color Book Series*<sup>TM</sup>, and it emphasizes up-to-date techniques in power system protection and coordination that are most applicable to industrial and commercial power systems. Coverage is limited to system protection and coordination as it pertains to system design treated in IEEE Std 141-1993<sup>1</sup> and IEEE Std 241-1990. No attempt is made to cover utility systems or residential systems, although much of the material presented is applicable to these systems.

This publication presents in a step-by-step, simplified, yet comprehensive, form the principles of system protection and the proper application and coordination of those components that may be required to protect industrial and commercial power systems against abnormalities that could reasonably be expected to occur in the course of system operation. The principles presented are applicable to both new electrical system design and to the changing, upgrading, or expansion of an existing electrical distribution system.

---

<sup>1</sup>Information on references can be found in 1.8.

plant or commercial business. Some operations can afford limited service interruptions to minimize the possibility of equipment repair or replacement costs, while others would regard such an expense as small compared with even a brief interruption of service.

In most cases, electrical protection should be designed for the best compromise between equipment damage and service continuity. One of the prime objectives of system protection is to obtain selectivity to minimize the extent of equipment shutdown in case of a fault. Therefore, many protection engineers would prefer that faulted equipment be de-energized as soon as the fault is detected.

However, for certain continuous process industry plants, high-resistance grounding systems that allow the first ground fault to be alarmed instead of automatically cleared are employed. These systems are described in Chapter 8.

### **1.1.2.3 Economic and reliability considerations**

The cost of system protection determines the degree of protection that can be feasibly designed into a system. Many features may be added that improve system performance, reliability, and flexibility, but incur an increased initial cost. However, failure to design into a system at least the minimum safety and reliability requirements inevitably results in unsatisfactory performance, with a higher probability of expensive downtime. Modifying a system that proves inadequate is more expensive and, in most cases, less satisfactory than initially designing these features into a system.

The system should always be designed to isolate faults with a minimum disturbance to the system and should have features to give the maximum dependability consistent with the plant requirements and justifiable costs. Evaluation of costs should also include equipment maintenance requirements. In many instances, plant requirements make planned system outages for routine maintenance difficult to schedule. Such factors should weigh into the economic-versus-reliability decision process.

When costs of downtime and equipment maintenance are factored into the protection system cost evaluation, decisions can then be based upon total cost over the useful life of the equipment rather than simply the first cost of the system. In-depth coverage of reliability-versus-economic decisions can be found in IEEE Std 493-1997.

## **1.2 Protection against abnormalities**

The principal electrical system abnormalities to protect against are short circuits and overloads. Short circuits may be caused in many ways, including failure of insulation due to excessive heat or moisture, mechanical damage to electrical distribution equipment, and failure of utilization equipment as a result of overloading or other abuse. Circuits may become overloaded simply by connecting larger or additional utilization equipment to the circuit. Overloads may also be caused by improper installation and maintenance, such as misaligned shafts and worn bearings. Improper operating procedures (e.g., too frequent starting,
