ANSI/IES TM-21-19

TECHNICAL MEMORANDUM: PROJECTING LONG-TERM LUMEN, PHOTON, AND RADIANT FLUX MAINTENANCE OF LED LIGHT SOURCES

AN AMERICAN NATIONAL STANDARD

Publication of this Committee report
has been approved by IES.
Suggestions for revision
should be directed to IES.

Approved by the IES Standards Committee October 11, 2019 as a Transaction of the Illuminating Engineering Society.

Approved as an American National Standard October 28, 2019.

Published by the Illuminating Engineering Society, 120 Wall Street, New York, New York 10005

IES Standards and Guides are developed through committee consensus and produced by the IES Office in New York. Careful attention is given to style and accuracy. If any errors are noted in this document, please forward them to Brian Liebel, Director of Standards, at standards@ies.org or the above address for verification and correction. The IES welcomes and urged feedback and comments.

Printed in the United States of America.

DISCLAIMER

IES publications are developed through the consensus standards development process approved by the American National Standards Institute. This process brings together volunteers representing varied viewpoints and interests to achieve consensus on lighting recommendations. While the IES administers the process and establishes policies and procedures to promote fairness in the development of consensus, it makes no guaranty or warranty as to the accuracy or completeness of any information published herein. The IES disclaims liability for any injury to persons or property or other damages of any nature whatsoever, whether special, indirect, consequential or compensatory, directly or indirectly resulting from the publication, use of, or reliance on this document.

In issuing and making this document available, the IES is not undertaking to render professional or other services for or on behalf of any person or entity. Nor is the IES undertaking to perform any duty owed by any person or entity to someone else. Anyone using this document should rely on his or her own independent judgment or, as appropriate, seek the advice of a competent professional in determining the exercise of reasonable care in any given circumstances.

The IES has no power, nor does it undertake, to police or enforce compliance with the contents of this document. Nor does the IES list, certify, test or inspect products, designs, or installations for compliance with this document. Any certification or statement of compliance with the requirements of this document shall not be attributable to the IES and is solely the responsibility of the certifier or maker of the statement.

AMERICAN NATIONAL STANDARD

Approval of an American National Standard requires verification by ANSI that the requirements for due process, consensus, and other criteria have been met by the standards developer.

Consensus is established when, in the judgment of the ANSI Board of Standards Review, substantial agreement has been reached by directly and materially affected interests. Substantial agreement means much more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that a concerted effort be made toward their resolution.

The use of American National Standards is completely voluntary; their existence does not in any respect preclude anyone, whether that person has approved the standards or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standards.

The American National Standards Institute does not develop standards and will in no circumstances give an interpretation to any American National Standard. Moreover, no person shall have the right or authority to issue and interpretation of an American National Standard in the name of the American National Standards Institute. Requests for interpretations should be addressed to the secretariat or sponsor whose name appears on the title page of this standard.

CAUTION NOTICE: This American National Standard may be revised at any time. The procedures of the American National Standards Institute require that action be taken to reaffirm, revise, or withdraw this standard no later than five years from the date of approval. Purchasers of American National Standards may receive current information on all standards by calling or writing the American National Standards Institute.

1.0 Introduction and Scope

1.1 Introduction

One of the benefits that LED light sources can provide is very long usable life. Unlike other lighting technologies, LEDs typically do not fail catastrophically* during use. However, over time the light output will gradually depreciate. At some point in time the light emitted from an LED depreciates to a level where it is no longer considered adequate for a specific application. It is important in lighting design to understand when this "useful lifetime" of an LED source is reached.

ANSI/IES LM-80-15, Approved Method for Measuring Luminous Flux and Color Maintenance of LED Packages, Arrays and Modules, defines the setup, conditions, and procedures for performing lumen maintenance testing of LED light sources. ANSI/IES LM-80-15 is the IES standard that is used widely to measure the lumen depreciation behavior of LEDs. LED device manufacturers routinely provide ANSI/IES LM-80-15 reports for their products, with data collected during testing for 6,000 hours or more. However, how the data collected from ANSI/IES LM-80-15 testing is used to best determine the useful lifetime of the tested product is not well defined.

The rated flux maintenance life of an LED is the elapsed operating time over which an LED light source maintains a given percentage of its initial light output. It is defined as τ_p, where τ is the lumen, photon or radiant flux, and p is the percentage value. For example, L_{70} is the time (in hours) when the luminous flux output from the LED has dropped to 70% of initial; Q_{90} is the time (in hours) when the photon flux output from the LED has dropped to 90% of initial; R_{80} is the time (in hours) when the radiant flux output from the LED has dropped to 80% of initial. The flux maintenance of an LED light source is dependent upon many variables, including the operating temperature, drive current, and technology and materials used to construct the product. As such, the flux maintenance of LEDs can vary not only from manufacturer to manufacturer, but also between different LED package types produced by a single manufacturer.

This Technical Memorandum recommends a method of projecting the flux maintenance of LED light sources from the data obtained by ANSI/IES LM-80-15 testing. This document was developed by a dedicated TM-21 Working Group of LED industry professionals. The analyses of the ANSI/IES LM-80-15 test data provided by major LED manufacturers are used to rationalize and support this document. Much of the ANSI/IES LM-80-15 data came from testing that extended to 10,000 hours, and in some cases beyond.

Note: In 2018, IES issued *PS-10-18, IES Position on LED Product Lifetime Prediction*.

1.2 Scope

This document provides recommendations for projecting flux maintenance of LED light sources using data obtained when testing them per *ANSI/IES LM-80-15, Approved Method for Measuring Luminous Flux and Color Maintenance of LED Packages, Arrays and Modules*.

This method shall not be used to project lumen, photon or radiant flux maintenance below 70%.

3.0 Definitions

In addition to the terms define in this section, illuminating engineering terms are defined in ANSI/IES RP-16-17.[2]

3.1 DUT

The *device under testing* is the LED light source as defined in **Section 3.2**.

* Used in this sense, a "*catastrophic failure* is a sudden failure that results in a complete inability to perform all required functions of an item." (Laplante, Philip A. Dictionary of Computer Science, Engineering and Technology. CRC Press, 2017)
