

Field-Applied Underground Wax Coating Systems for Underground Metallic Pipes: Application, Performance, and Quality Control

This NACE International (NACE) standard represents a consensus of those individual members who have reviewed this document, its scope, and provisions. Its acceptance does not in any respect preclude anyone, whether he or she has adopted the standard or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not in conformance with this standard. Nothing contained in this NACE standard is to be construed as granting any right, by implication or otherwise, to manufacture, use, or use in connection with any method, apparatus, or product covered by letters patent, or as indemnifying or protecting anyone against liability for infringement of letters patent. This standard represents minimum requirements and should in no way be interpreted as a restriction on the use of better procedures or materials. Neither is this standard intended to apply in all cases relating to the subject. Unpredictable circumstances may negate the usefulness of this standard in specific instances. NACE assumes no responsibility for the interpretation or use of this standard by other parties and accepts responsibility for only those official NACE interpretations issued by NACE in accordance with its governing procedures and policies which preclude the issuance of interpretations by individual volunteers.

Users of this NACE standard are responsible for reviewing appropriate health, safety, environmental, and regulatory documents and for determining their applicability in relation to this standard prior to its use. This NACE standard may not necessarily address all potential health and safety problems or environmental hazards associated with the use of materials, equipment, and/or operations detailed or referred to within this standard. Users of this NACE standard are also responsible for establishing appropriate health, safety, and environmental protection practices, in consultation with appropriate regulatory authorities if necessary, to achieve compliance with any existing applicable regulatory requirements prior to the use of this standard.

CAUTIONARY NOTICE NACE standards are subject to periodic review, and may be revised or withdrawn at any time in accordance with NACE technical committee procedures. NACE requires that action be taken to reaffirm, revise, or withdraw this standard no later than five years from the date of initial publication and subsequently from the date of each reaffirmation or revision. The user is cautioned to obtain the latest edition. Purchasers of NACE standards may receive current information on all standards and other NACE publications by contacting the NACE FirstService Department, 15835 Park Ten Place, Houston, TX 77084-5145 (telephone +1 281-228-6200, or email firstservice@nace.org).

ABSTRACT

This NACE International standard practice includes guidelines for surface preparation, material requirements, application, and handling of hot- and cold-applied wax and component wrappers and wax-based tape coating systems for the protection of underground pipe, fittings, and valves. The standard outlines material requirements for hot- and cold-applied wax coatings, and handling of the coated components, and includes five tables that provide material requirements and references to standard test methods for the various coating materials discussed. This standard is intended for use by corrosion control personnel, design engineers, project managers, purchasers, and construction engineers and managers.

KEYWORDS

coatings, cold-applied wax coatings, hot-applied wax coatings, microcrystalline wax coating, overwrap, pipelines, protective coatings, surface preparation, tape coating systems, TG 296, STG 03, wax coating systems, ASTM D92, RP0375, SP0169

In NACE standards, the terms “shall,” “must,” “should,” and “may” are used in accordance with the definitions of these terms in the NACE Publications Style Manual. The terms “shall” and “must” are used to state a requirement, and are considered mandatory. The term “should” is used to state something good and is recommended, but is not considered mandatory. The term “may” is used to state something considered optional.

Foreword

Wax coating systems are designed to aid in the protection of underground metallic pipes from corrosive environments. This NACE International standard practice covers surface preparation, material requirements, application, and handling of hot- and cold-applied wax and component wrappers and wax-based tape coating systems for the protection of underground pipe, fittings, and valves. This standard is intended for use by corrosion control personnel, design engineers, project managers, purchasers, and construction engineers and managers.

This standard was originally prepared in 1975 by Task Group (TG) T-10D-16, a component of NACE Unit Committee T10D on “Protective Coating Systems.” It superseded NACE Publication 2L161.¹ The scope of the original NACE Standard RP0375 included only the application of hot- and cold-applied wax coatings. When this standard was revised by the task group in 1994, the section on wax-based tape coatings was added. In 1999, this standard was reviewed by TG T-10D-17/T6A-63 and reaffirmed with editorial changes. In 2018 and 2006, it was revised by TG 296, which is administered by Specific Technology Group (STG) 02, “Protective Coatings and Linings—Immersion/Buried.” It is sponsored by STG 04, “Protective Coatings and Linings—Surface Preparation”; and STG 35, “Pipelines, Tanks, and Well Casings.” This standard is issued by NACE under the auspices of STG 03.
